Qx

Completed for now

Q: Why do we need to be careful when handling OSS?

A:

- licensing
  - Software is protected by copyright and licenses
    - you must comply with the license
      - respect for the authors is necessary
    - there have been court cases involving license violations
  - With OSS, you can obtain and use it without going through formal procedures such as signing a contract
    - Normally, you would verify the license terms through contractual procedures, but with OSS, people sometimes use it without doing so
    - It is adopted on a grassroots level and becomes unmanageable
  - Some OSS components are automatically included due to dependencies
    - There are cases where users are unaware they are using certain components
  - you must understand the difference between freeware and OSS and use them in accordance with their terms of use
    - there are often cases where it's hard to know what to do—this is where the OSPO comes in
- use with confidence
  - Security (Vulnerabilities)
    - If a problem is discovered after deployment, a response is required. If you don't know what you're using at that point, the response will be delayed or impossible
    - Because it is widely used and its source code is publicly available, it is easier for attackers to exploit
      - On the other hand, because there are many developers and users, countermeasures are implemented quickly
  - Using OSS with Confidence
    - it depends on the state of the community
    - Maintain a sense of security by contributing to and participating in the community
-
- Note: Based on the assumption of an initial-stage question

The OpenChain Project Japan Work Group / CC0-1.0

Q: What are the benefits of utilizing OSS and engaging in OSS activities?

A:

- Benefits of using open-source software
  - You can use existing software (which makes development easier)
  - you can use cutting-edge software (technology)
  - since the software is created by a large community, it is of high quality
  - because so many people use it, bugs are easier to find, and fixes are both accurate and prompt
- benefits of community activities
  - efficient use of development resources through community collaboration
  - opportunities to recruit talent (for companies)
    - as a developer, you can enhance your value and gain opportunities to contribute
    - talent development
- business strategy benefits
  - expansion of the market and potential customer base through the community, and involvement in shaping development directions
  - establishment and adoption of de facto standards

~~we will consider mapping this to the OSPO stages next time (May 26, 2023)~~

The OpenChain Project Japan Work Group / CC0-1.0

Q: What are the benefits of utilizing OSS and engaging in OSS activities?

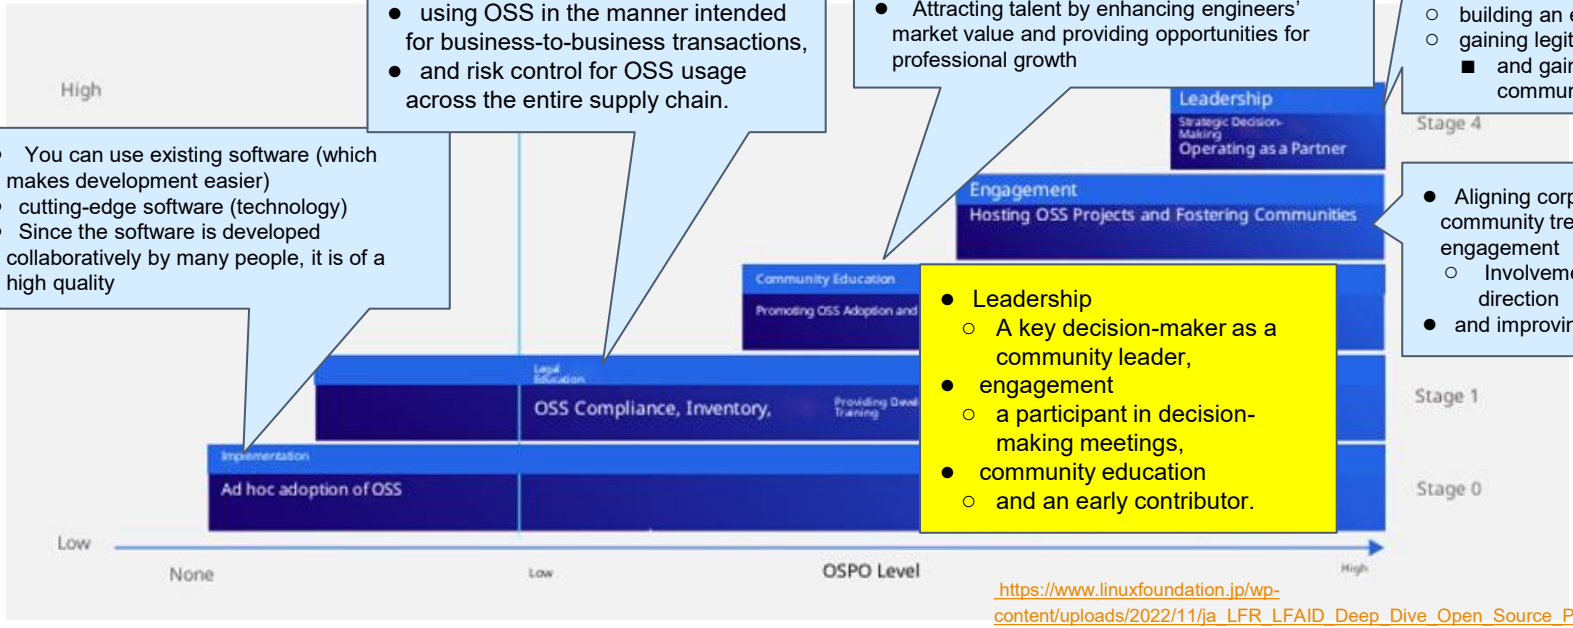

Fix

- Compared to handling it in-house, having many engineers involved makes it easier to find bugs, and fixes are more accurate and faster
- Efficient use of development resources through community collaboration
- A platform for talent development, retention, and acquisition
- Attracting talent by enhancing engineers' market value and providing opportunities for professional growth

- Creation of businesses leveraging OSS
  - Expansion of the market and potential customer base,
  - establishment and adoption of de facto standards,
  - building an ecosystem,
  - gaining legitimacy for our activities,
    - and gaining endorsement from community participants.

- Enabling businesses to use OSS properly and with confidence,
- using OSS in the manner intended for business-to-business transactions,
- and risk control for OSS usage across the entire supply chain.

- You can use existing software (which makes development easier)
- cutting-edge software (technology)
- Since the software is developed collaboratively by many people, it is of a high quality

- Leadership
  - A key decision-maker as a community leader,
- engagement
  - a participant in decision-making meetings,
- community education
  - and an early contributor.

- Aligning corporate expectations with community trends through community engagement
  - Involvement in development direction
- and improving engineer motivation

https://www.linuxfoundation.jp/wp-content/uploads/2022/11/ja_LFR_LFAID_Deep_Dive_Open_Source_Program_Offices_0830.pdf
Ibrahim Haddad, **"A Deep Dive Into Open Source Program Offices: Structure, Roles, Responsibilities, and Challenges** ," foreword by Chris Aniszczyk, August 2022

The OpenChain Project Japan Work Group / CC0-1.0

Q: What are the benefits of utilizing OSS and engaging in OSS activities?

Fix

- Using OSS properly and with confidence in business,
- using OSS in the manner intended for inter-company transactions,
- and controlling risks associated with OSS usage across the entire supply chain.

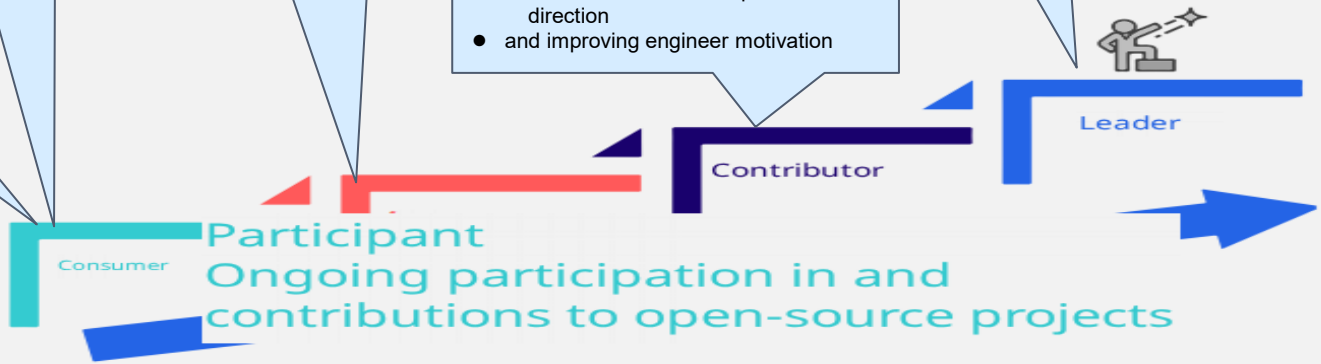

- You can use existing software (which makes development easier)
- ability to use cutting-edge software (technology)
- since the software is created by a large community, it is of a high quality

- compared to handling it in-house, bugs are more easily detected by a larger pool of engineers, and fixes are more accurate and faster
- efficient use of development resources through community collaboration
- a platform for talent development, retention, and acquisition
- attracting talent by enhancing engineers' market value and providing opportunities for professional growth

- Aligning corporate expectations with community trends through community engagement
  - Involvement in development direction
- and improving engineer motivation

- Creation of businesses leveraging OSS
  - Expansion of the market and potential customer base,
  - establishment and adoption of de facto standards,
  - building an ecosystem,
  - gaining legitimacy for the initiative,
    - and gaining endorsement from community participants.

Figure 9
The Four Core Stages of Open Source Strategy—Consumer, Participant, Contributor, Leader

The OpenChain Project Japan Work Group / CC0-1.0

What Exactly Is an OSPO?

October 27, 2023 Discussion—Next meeting on December 22 (to be continued)

- (Let's summarize it as an overarching concept)
- What OSPO Does
  - Challenges:
    - Addressing the current situation where OSS accounts for over 80% of software usage
  - Initiatives:
    - Identifying and promoting the best ways for the company to engage with OSS and the OSS community
- As I briefly mentioned before, I feel that the OSPO exists to bridge the cultural gap between the company and the OSS community
  - It feels like we're just playing catch-up, so I feel it's insufficient.
- The OSPO acts as a bridge between the organization and the OSS community
- The OSPO's role is to drive a "stage-up" in awareness and mindset within the company
- Not limited to engineers, the OSPO works to instill an OSS-style way of working—which is becoming the norm externally—within the organization
- It's an effort to adopt practices that have proven successful in the OSS community to effectively manage large-scale development projects
- Efforts to integrate the company into the ecosystem created by OSS (to become a member of it)
- Developing the company's business by leveraging the OSS ecosystem
  - To bridge the gap between corporate logic and OSS logic, aiming for the mutual growth of both
  - Corporate engineers active in OSS communities should be allowed to devote themselves fully to OSS activities
    - OSPO members are responsible for formulating and executing strategies while also considering the corporate perspective separately from these individuals
    - If OSPO members and OSS activity members are conflated, it creates difficulties for the activity members
- The role of OSPO members within the company
  - They are neither part of a business division nor OSS activity engineers. They consider both perspectives.
  - They switch between these multiple roles as needed. (This is what makes running an OSPO challenging.)
- The goal is to aim for—and create—a situation where OSS activities provide value and benefits to both the company and the OSS community
- Why not start by discussing the meaning behind the name "Open Source Program Office"?
- The Meaning of "Program"
  - A "program officer" (PO) is someone who plans, designs, and manages research or grant programs at research institutions, think tanks, foundations, and similar organizations.
  - Some view it as an ongoing activity

The OpenChain Project Japan Work Group / CC0-1.0

What exactly is an OSPO?

Continued on December 22, 2023

- What skills are required of OSPO members,
  - Is the range of skills required broad?
  - software development skills (at a certain level)
  - Knowledge of licensing
    - Basic knowledge of legal and intellectual property matters
    - Shared understanding within the community (intent, context)
  - Communication skills
    - English proficiency
    - A spirit of respect
  - Motivation and the mental resilience to weather adversity
  - ability to explain
    - teaching skills
  - Experience with and aptitude for community activities
    - A sound understanding of OSS development methodologies, ecosystems, and communities
    - understanding and respect for OSS and community culture
      - participants' values
- what are the responsibilities of an OSPO,
  - license management
  - proposals and advice on utilizing OSS in business strategy
  - fostering activity in the OSS community
  - OSS awareness
    - raising awareness of risks associated with OSS use
    - raising awareness of the value of OSS and community benefits
  - CLA management:
- and the internal authority that should be granted to the OSPO?
  - channels for communication with C-level executives

The OpenChain Project Japan Work Group / CC0-1.0

What Exactly Is an OSPO?

December 22, 2023
(Continued)

- What is the optimal size for an OSPO?
  - What percentage of the total engineering staff?
    - varies depending on the maturity stage of the OSS (larger initially, gradually becoming smaller)
- what kind of external engagement is necessary for an OSPO?
  - Participating in, contributing to, and discussing OSS events
  - Absorbing external information and bringing it back into the company
  - Supporting the company (and its engineers) in sharing opinions externally to foster a common understanding
  - promoting the company's stance (collaboration, building partnerships, talent acquisition)
- management of OSS projects
  - Strategy and management of CLA establishment
- M&A perspective
  - Support not only for corporate acquisitions but also for project acquisitions (?)
- methods for evaluating OSPO performance
  - Methods for Justifying Activities
  - Percentage of Supporters Within the Company
  - How to Demonstrate Contribution to the Business
  - Awareness
- what marks the start of an OSPO?
  - License Compliance, Education

- Reference:https://ospomindmap.todogroup.org/jp

The OpenChain Project Japan Work Group / CC0-1.0

What Is an OSPO, Anyway?

Continued on January 26, 2024

- The OSPO works (in various ways) to ensure the entire organization can handle OSS appropriately
- Does it apply to the entire organization, or just the departments that handle OSS?
  - Taking DX as an example, it's about the entire organization leveraging IT to drive change—this is the OSS equivalent.
  - the entire organization must transform to align with OSS
  - it means becoming an Open Source Company
    - becoming like Red Hat
      - adopting the methods of the open-source community for technology development and information dissemination
      - companies that successfully bridge the gap between the organization and the OSS community
        - a "bridge" refers to the ability to understand and communicate within the context of both corporate norms and community norms
        - creating a state where the entire organization, each department, and every individual can act as a bridge and is actively doing so
  - examples of "bridging"
    - A state where the Planning Department and Development Department can smoothly launch new businesses utilizing OSS based on their understanding of the OSS community
    - a state where everyone in the organization understands that OSS contributions bring business benefits and puts this into practice
      - a state where there is a clear explanation of how OSS contributions are linked to business activities
    - as OSS comes to occupy a larger share of the world, business activities must adapt to societal changes, and engaging in OSS activities will become a means to achieve this
      - addressing AI and new regulations (security, ethics, etc.)
    - examples of business benefits
      - For SoC vendors, OSS activities ensure that the Linux distribution for their SoCs is maintained stably and over the long term by the community, leading to increased adoption of their SoCs and greater differentiation
      - engaging in open-source activities enhances a company's reputation and works to the advantage of product reliability and adoption
      - encouraging the use of OSS creates a potential market among users
        - and by increasing the number of OSS users, a viable support business can be established
        - Example: Android

The OpenChain Project Japan Work Group / CC0-1.0

What exactly is an OSPO?

Continued from February 16, 2024

- How about saying, “An OSPO is a guide for an organization’s OSS journey”?
  - An organization’s OSS journey varies from one organization to another
  - rather than leading the way from the front, I think the role is more about providing support and encouragement, so the term “guide” doesn’t quite fit
- an organization has its own direction and strategy, and the OSPO’s role is to show how best to engage with OSS and the OSS community to achieve those goals and to drive that process forward
  - The specific actions taken will vary depending on the organization’s current stage
  - For example,
    - For example, engaging with existing departments within the organization
    - where the OSPO acts as a bridge between the Corporate Portfolio and Project Management
    - At Stage 0, the OSPO demonstrates the need for compliance and conducts activities to promote a broader understanding of licenses.
    - At Stage 1, communicate the benefits of providing bug fixes to the community
    - In Stage 2, demonstrate the benefits of sharing development effort (costs) through OSS contributions. Establish internal systems and policies that facilitate OSS activities.
    - In Stage 3,
    - In Stage 4,
  - Since the organizational structure for OSS varies from company to company,
- I think it would be worthwhile to discuss what the “OSS Journey” actually entails
- How should we explain the OSS Initiative?
- Effectively communicating “Shared Cost”
- How to explain “Program” —> We’ll delve into this a bit more next time!
  - Since the organizational structure for OSS varies from company to company, the term “Program” is used here as defined by the PMI (Project Management Institute)
  - PMO = Program Management Office: An organization designed to effectively manage multiple projects
  - PMP website: https://ssaits.jp/promapedia/concepts/project-program-portfolio.html
  - Program = “an officially organized system of services, activities, or opportunities that help people achieve something” (from https://dictionary.cambridge.org/ja/dictionary/english/program)
  - https://ospoglossary.todogroup.org/ospo-definition/
- Why not say, “The role of the OSPO is to understand the changes in the business environment brought about by OSS and to work toward ensuring the company adapts to that ever-changing environment”?
  - There are also stages to “adaptation”: (1) reacting to changes that directly affect the company; (2) understanding the background of the changes, predicting what will happen next, and preparing for it; (3) envisioning a desirable state and driving the changes necessary to achieve it; and so on
- Items raised on 2/29: Discuss how to launch the OSPO and its strategy

The OpenChain Project Japan Work Group / CC0-1.0

What exactly is an OSPO?

Continued on March 22, 2024

- Why not try saying, “the role of the OSPO is to understand the changes in the business environment brought about by OSS and to work toward ensuring the company adapts to that ever-changing environment”?
  - There are also stages to “adaptation”: → “Adapt and coexist”
    - ① Respond to changes that directly affect us,
    - ② Understand the context of the changes, predict what will happen next, and prepare,
    - ③ Envision the desired state and drive the changes necessary to achieve it,
    - and so on.
  - Once a certain stage is reached, the OSPO begins to act as a bridge between the community and the organization
  - OSPO can act as a bridge to ensure that recruitment and other activities run smoothly by encouraging HR to engage with the OSS community,
    - such as distributing company brochures within the community or becoming a sponsor.
- The perceived distance between the OSS world and the company depends on how well the company understands OSS
  - As the maturity level increases, the distance narrows.
  - Although there is a distance at first, the company gradually becomes more involved in the OSS world.
  - The approach and scale of this integration form the company’s OSS strategy.
- Items raised on 2/29: How to launch an OSPO / Discussing strategies: OSPO Strategy

OSPO Strategy: How to Launch an OSPO / Strategy

Continued on March 22, 2024

- Stage 0 → Stage 1 Strategy:
  - Share examples of litigation,
  - learn the hard way, and realize the necessity.
- identify OSS-related issues, get a big-picture view, then prioritize and tackle them.
  - If you chase only the immediate issues, you'll end up in a fog with no end in sight.
  - It's easier to proceed if you grasp the big picture first,
- When you decide to establish an OSPO, you need an OSS strategy.
  - but creating a strategy isn't easy.
  - For each example of an OSS strategy, consider what the OSPO should do to implement it
- Let's consider what an OSPO would do to implement the OSS strategy of a "second-tier" company (a company that develops and sells products such as TVs and cameras) that is involved in strategy discussions.
  - What is this company's OSS strategy?
    - Contribute bug fixes
    - Ensuring compliance
    - Keeping up with version updates

The OpenChain Project Japan Work Group / CC0-1.0

What Does “Program” Mean in the Open Source Program Office?

April 26, 2024

- Participants: 7
- Portfolio, Program, Project
- Project – Product
- A Project produces an “Output,” while a Program produces an “Outcome”
- The scope of an OSPO’s activities within a company varies from company to company
  - Project level, Program level, Portf
- It might be better not to get too h
  = Open Source Office
- After all, including the word "Prog
  is better, as it conveys the aspect

OSPO: Open Source Program Office

■ Objective:

By examining the meaning of “Program Office” in “Open Source Program Office” based on the PMI definition, we can gain insights into the role of the OSPO

■ Question:

What does “Program” mean in “Open Source Program Office”?

■ Answer:

□ While a “Program Office” is a physical space where members engaged in program activities gather, from a management perspective, it is viewed as an organization that fulfills the role of a “Program Management Office (PgMO).”

▫ A “Program Management Office (PgMO)” is a management organization that standardizes frameworks and procedures for decision-making, oversight, and management related to a “program”—a collection of “projects”—and promotes the sharing of resources, methodologies, tools, and techniques.

b. “OSPO” can be understood as a management organization that “standardizes frameworks and procedures for decision-making, oversight, and management related to open source, and promotes the sharing of resources, methodologies, tools, and techniques.”

The OpenChain Project Japan Work Group / CC0-1.0

- At first, contributions were grassroots efforts to persuade management here
- the OSPO was created to coordinate these efforts as a company-wide initiative
- OSPO is difficult to achieve through grassroots efforts alone; a top-down approach is also necessary
  - How do we generate this top-down approach? I'd like to see some best practices…
  - it would be helpful to have a document titled "The Path to Becoming a COSO (Chief Open Source Officer)."
- To get the company to recognize OSS from a business perspective, it's easier to get C-level executives on board
- Feedback from Sales:
  - In the software business, there's a growing recognition that understanding OSS and the community gives you an advantage when selling
- It would be helpful to clearly and accurately convey that understanding OSS and the community—as well as participating in the community to help shape standards—is beneficial even in non-software businesses, such as those dealing with SBOMs and export controls
  - and some customers are also paying attention to these aspects.

The OpenChain Project Japan Work Group / CC BY 4.0

What is an OSPO?

Discussion on August 25, 2023

- Its position in the organizational chart varies by company.
  - Roles also vary:
  - within R&D, the CTO's Office, the Security Department, Risk and Compliance, Quality Assurance, or Legal and Intellectual Property.
  - Depending on the stage the company is in, its placement within the above departments will vary
  - The fact that its role doesn't fit neatly into any single category listed above is why there's debate over where to place it
  - It also depends on which OSPO role the company prioritizes
- The OSPO serves as a bridge to help the company collaborate with the distinct culture of open source, providing a framework for its smooth adoption and utilization
- it is an organization that facilitates collaboration with OSS communities, groups, and organizations—which embody the distinct culture of open source—and aims to ensure that its activities are naturally integrated into the community's momentum.
- a preparatory unit designed to understand the culture of OSS communities and enable the company to act appropriately within them in order to leverage OSS (this is the definition around Stages 0 and 1)
  - This concept will continue to evolve
- There are various models for OSPOs;
  - Virtual — Real
  - Multiple locations — Centralized in one location
    - In terms of how they form, there is likely a trend where multiple OSPOs emerge independently within a company and then consolidate into a single entity as the organization grows
  - An OSPO ceases to function effectively when consolidated into a single location
    - People start thinking, "We can just leave it to them," and things don't work out
      - I'm concerned that this will lead to a cessation of efforts to learn about OSS culture
- they play a role in raising awareness and fostering adoption
- Ultimately, to be able to contribute to external OSS communities, we must first share OSS information internally, build an internal OSS community, and foster active interaction.
- There is a lifecycle: it grows larger, and once it becomes widespread, it shrinks.
  - Embedding the culture → Business application
- One aspect of the OSPO's mission is to realize the principle that "community contribution equals company success."
- Is it the OSPO's role to identify changes in industry culture and trends and update the company's internal culture accordingly?
- The OSPO's role is to identify trends within the community and apply them to the business (culture is one such aspect) [Is this a corporate planning activity?]

The OpenChain Project Japan Work Group / CC BY 4.0

What is an OSPO?

I've summarized what an OSPO does at companies in each stage

October 27, 2023
Fixed for now

Q: What is an OSPO?

A:

- Benefits of using open-source software
  - You can use existing software (which makes development easier)
  - ability to use cutting-edge software (technology)
  - since the software is created by a large community, it is of a high quality
  - because so many people use it, bugs are easier to find, and fixes are both accurate and prompt
- benefits of community activities
  - efficient use of development resources through community collaboration
  - opportunities to recruit talent (for companies)
    - as a developer, you can enhance your value and gain opportunities to contribute
    - talent development
- business strategy benefits
  - expansion of the market and potential customer base through the community, and involvement in development direction
  - establishment and adoption of de facto standards

~~We will consider mapping this to the OSPO stages next time (May 26, 2023)~~

The OpenChain Project Japan Work Group / CC0-1.0

What is an OSPO?
Qx I've summarized what an OSPO does at companies at each stage

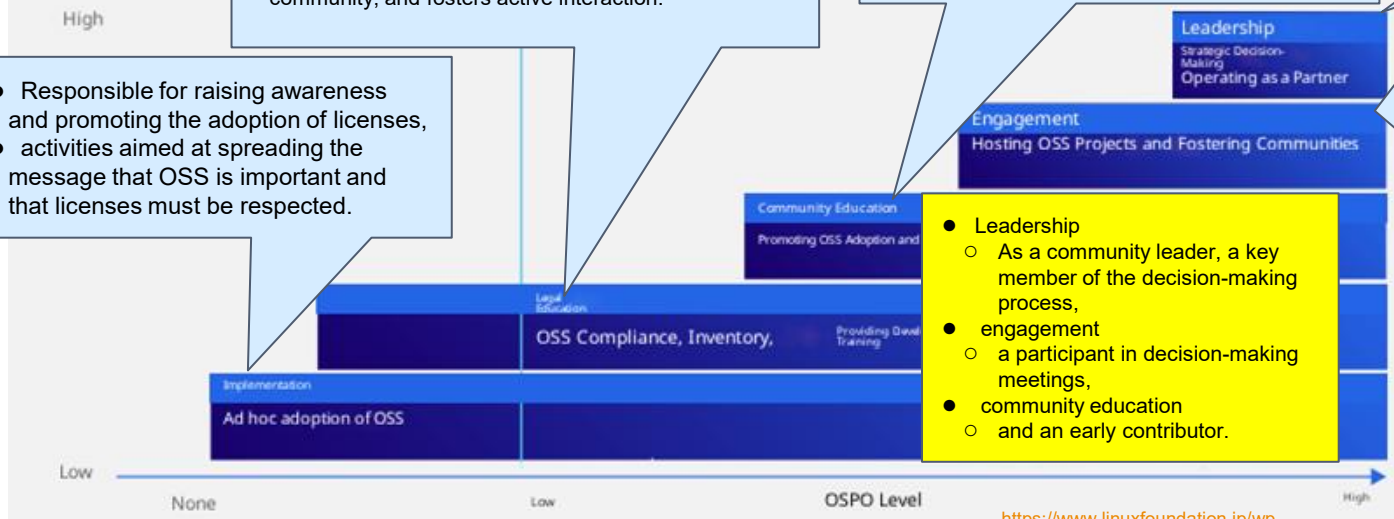

October 27, 2023
fix for now

- The OSPO is responsible for promoting strict compliance with licensing across the entire company,
- an office dedicated to preparing the company to understand the culture of OSS communities and act appropriately within the organization to leverage them.
- With the long-term goal of contributing to external OSS communities, the OSPO first facilitates the sharing of OSS information internally, builds an internal OSS community, and fosters active interaction.

- The OSPO acts as a bridge to help the company collaborate with the distinct culture of open source, providing a framework for its smooth adoption and utilization;
- it is an organization that facilitates collaboration with OSS communities, groups, and organizations—which embody a distinct "open source" culture—and aims to ensure that its activities are naturally integrated into the community's momentum.

- The OSPO's role is to identify trends within the community, lead the community, generate new trends, and leverage them for the business
- and to work toward embedding the above principles as part of the corporate culture

- Responsible for raising awareness and promoting the adoption of licenses,
- activities aimed at spreading the message that OSS is important and that licenses must be respected.

- Leadership
  - As a community leader, a key member of the decision-making process,
- engagement
  - a participant in decision-making meetings,
- community education
  - and an early contributor.

- One aspect of the OSPO's mission is to realize the principle that "community contribution equals company success."
- its role is to stay abreast of changes in industry culture and trends and update the company's internal culture accordingly

Roles independent of stage,
- responsible for raising awareness and driving adoption,
- has a lifecycle: it grows larger and then shrinks once it's established

https://www.linuxfoundation.jp/wp-content/uploads/2022/11/ja_LFR_LFAID_Deep_Dive_Open_Source_Program_Offices_0830.pdf
Ibrahim Haddad, **"A Deep Dive Into Open Source Program Offices:" Structure, Roles, Responsibilities, and Challenges** ," foreword by Chris Aniszczyk, August 2022

The OpenChain Project Japan Work Group / CC0-1.0

Reflections on the Growth of the OSPO Organization

September 22, 2023 Discussion

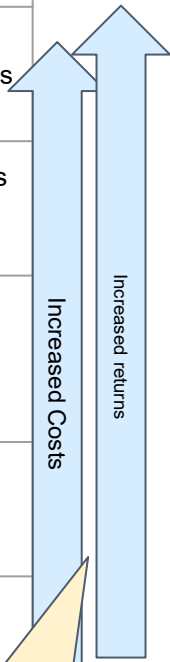

- The specific location on the organizational chart varies by company,
  - Roles also vary:
  - within R&D, the CTO Office, Security Office, Risk and Compliance, Quality Assurance, and Legal and Intellectual Property.
  - Depending on the stage the company is in, the placement within the above categories will vary
  - The fact that its role doesn't fit neatly into any single category listed above is why there is debate over where to place it
  - It also depends on which OSPO functions the company prioritizes
- there are various models for OSPOs.
  - Virtual — Real
  - Multiple locations — Centralized in one location
    - Historically, there is a trend where multiple OSPOs emerge independently within a company and then consolidate into a single entity as the company grows
  - An OSPO ceases to function effectively when consolidated into a single location
    - People start thinking, "We can just leave it to them," and things don't work out
      - I'm concerned that this will lead to a cessation of efforts to learn about OSS culture
- Let's consider how an OSPO gets started.
  - In the early days, the term "OSPO" didn't exist; people were simply evangelizing the importance of OSS and the need to comply with licenses.
  - We started by deepening our understanding of licenses like the GPL
  - The OSPO lifecycle itself:
    - Ibrahim's session at OSS EU: https://sched.co/1OZJh (around the 1:05 mark)
- Reference: In-Depth Analysis: "Open Source Program Office" – The Linux Foundation https://www.linuxfoundation.jp/publications/2022/11/a-deep-dive-into-open-source-program-offices/
  - Ibrahim Haddad, **"A Deep Dive Into Open Source Program Offices: Structure, Roles, Responsibilities, and Challenges"** ," foreword by Chris Aniszczyk, August 2022

Changes in Attitudes Toward OSS

October 27, 2023
Discussion

	Use in Business Operations	Compliance	Contributions
Stage 4	Understanding that revitalizing the community is necessary for business stability	Proposing and promoting better licensing practices	Proposing and promoting the development of new features and modules
Stage 3	Understand that good communication with the community leads to product improvement	Exchange opinions with the community regarding licensing practices and tools	Participate in community update activities and bug fixes
Stage 2	Realize that the product is, in fact, of high quality, and that even when bugs occur, they are fixed.	Respect the community's opinions and feedback	Utilize update and bug information from the community. Report discovered bugs and provide usage feedback
Stage 1	Comply with the license by providing the minimum required usage reports and disclosing information	Minimum legally required compliance	Minimum source code disclosure in accordance with the license
Stage 0	Using it because it's free	I'm not really sure. As long as no one finds out, it's fine.	Handing over my code is a loss

The balance point between cost and return varies by company

The OpenChain Project Japan Work Group / CC0-1.0

July 11 Plenary Session Breakout Session

Q: What does an OSPO need? How do you set up an OSPO?

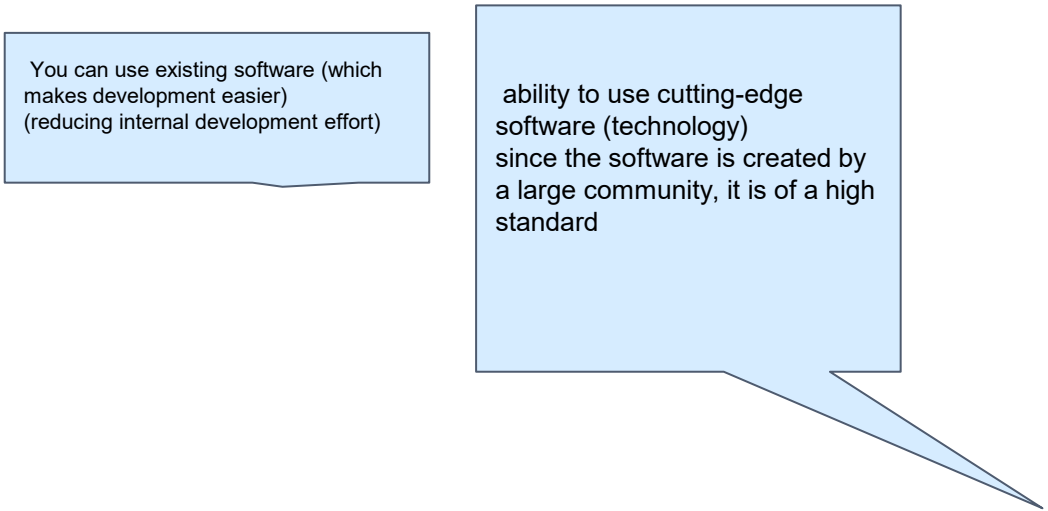

A:

- Resources (people, money)
  - The scale varies depending on what the OSPO does:
  - minimum requirement: ensure thorough internal license compliance;
  - beyond that: the scale increases as activities expand to include training, community contributions, and strategy.
  - Considering organizational continuity, the minimum required headcount is several people.
- mindset

- top management's commitment
  - Top management's perspective is crucial because it involves financial implications.
    - While license compliance is generally considered a must, how can we move beyond that?

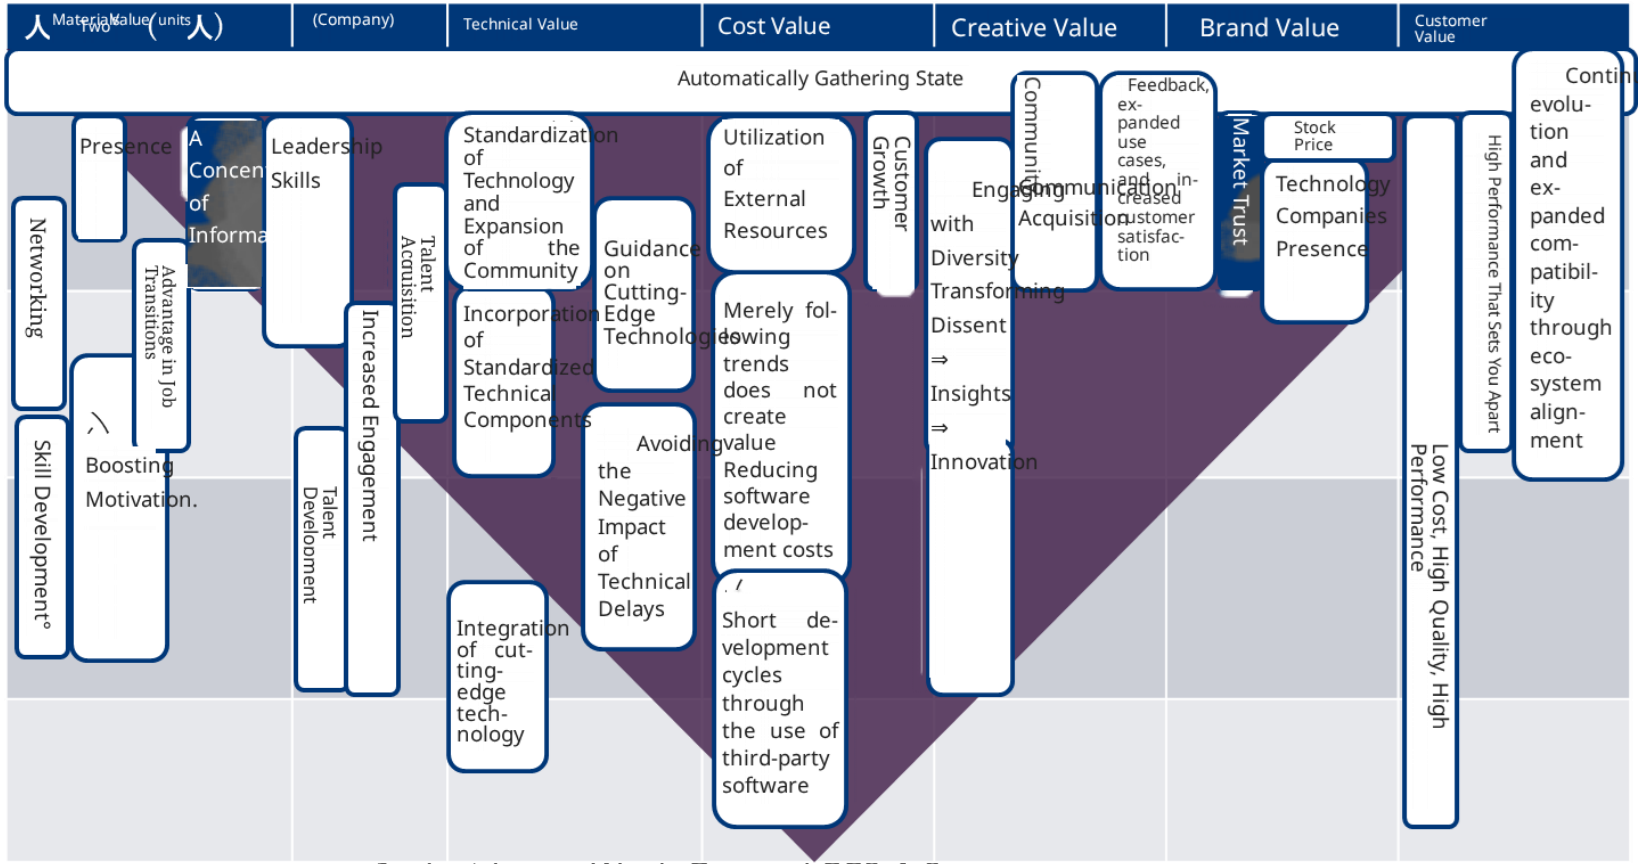

The OpenChain Project Japan Work Group / CC0-1.0

Steps to Start Using OSS

The OpenChain Project Japan Work Group / CC0-1.0

Open Source Value Map: From Consumer to Leader

The OpenChain Project Japan Work Group / CC0-1.0

Open Source Value Map: From Consumer to Leader

	Human Capital Value (Individual)	(Company)	Technical Value	Cost Value	Creative Value	Brand Value	Customer Value

The OpenChain Project Japan Work Group / CC0-1.0

Qx

Q: Why is it difficult to take on a leadership role in a community?

A:

The OpenChain Project Japan Work Group / CC0-1.0

Qx

Q: Why is company-wide, unified management of OSS necessary? (Why now, when OSS is already widely used?)

A:

- importance
  - U.S. Presidential Executive Order Requiring OSS Supply Chain Management: It has become a procurement requirement
    - there is a growing need for robust management from a security perspective
  - as OSS has become a cornerstone of social infrastructure systems
    - where problems with embedded OSS can have a major impact
  - ISO Standardization and Industry Initiatives (e.g., Teleco WG)
- the need for company-wide unified management
  - Mistakes made by a single department can affect the entire company (a mistake by another business unit can damage the reputation of one's own unit)
  - Improving the overall level of the internal supply chain
  - Non-software engineers are increasingly handling OSS
    - Management of outsourced work; hardware managers overseeing the entire product, including software; varying levels of understanding regarding OSS compliance among outsourcing partners, etc.
-
- background of Q:
  - I take pride in having done what I believed needed to be done on the front lines, so why is the company now trying to tackle this as a company-wide initiative?
  - Negative reactions have arisen because the company has started creating rules even though there are no actual problems

Qx

Q: How should we proceed with the OSPO?

A:

- Start by looking at examples from other companies to identify challenges your own company hasn't yet recognized.
- It's a good idea to explain why you're establishing the OSPO.
- we'd like to prepare answers for those considering setting up an OSPO for the first time
  - (Example) When trying to establish an OSPO internally, having examples from other companies makes it easier to raise awareness within the company
- the structure of an OSPO can vary from company to company
  - it's a good idea to start by clearly defining the reasons for establishing an OSPO
- for example,
  - software development company A:
    - The driving force lies within each organizational unit, with the OSPO providing support.
    - Each department has OSPO members, and the OSPO functions as a virtual, unified organization
- (for both software house-type and non-software house-type companies)
- Reference Materials

Qx

Q: (TO: Companies that already have an OSPO) Why did you establish an OSPO?

A:

- Start by looking at examples from other companies to identify challenges your own company hasn't yet recognized
- It's a good idea to explain why you established the OSPO
- We want to prepare answers for those considering establishing an OSPO for the first time
  - (Example) When trying to establish an OSPO internally, having examples from other companies makes it easier to raise awareness within the company
- The structure of an OSPO can vary from company to company
  - It's a good idea to start by clearly defining the reasons for establishing an OSPO
- For example
  - Software development company A:
    - The driving force lies within each organizational unit, with the OSPO providing support.
    - Each department has OSPO members, and the OSPO functions as a virtual organization composed of them
- (for both software house-type and non-software house-type companies)
- Reference Materials
  - https://www.linuxfoundation.jp/publications/2022/11/a-deep-dive-into-open-source-program-offices/

Qx

Q: I want to set up an OSPO. Where should I start?

A:

- Start by looking at examples from other companies to identify challenges your own company hasn't yet recognized
- It's a good idea to explain why you decided to establish an OSPO
- I'd like to prepare an answer for those considering setting up an OSPO for the first time
  - (Example) When trying to establish an OSPO internally, having examples from other companies makes it easier to raise awareness within the company
- The structure of an OSPO can vary from company to company
  - it's a good idea to start by clearly defining the reasons for establishing an OSPO
- For example
  - Software development company A:
    - the driving force lies within each organizational unit, with the OSPO providing support.
    - Each department has OSPO members, and the OSPO functions as a virtual, unified organization
- (for both software house-type and non-software house-type companies)
- Reference Materials

Question Candidates (Text in blue was added during the meeting)

1. Why is OSS management necessary? (Why now, when OSS is already widely used?) Slide Link
2. What is an OSPO?
3. (TO: Companies that already have an OSPO) Why did you establish an OSPO?
4. We want to establish an OSPO—where should we start?
5. What is the organizational structure and membership composition of an OSPO?
   a. (for both software house-type and non-software house-type companies)
6. What is the OSPO's organizational structure and authority?
   a. (e.g., OSPO budget, OSPO reporting lines, OSPO response to violations of established internal rules, etc.)
7. Do you require SBOMs from software vendors?
   a. (When? What format? How is the content verified? How often is it updated? Do you request updates?)
8. Are there sufficient tools for SBOM management?
   a. (How do you review the contents of the SBOM? What are the criteria for assessing SBOM quality? Can you view SBOM differences?)
9. What about OSS copyrights?
   a. (Are we complying with copyright law? Do we have internal policies? Are community activities considered work-related? What about personal OSS developed before joining the company?)
10. Are you managing OSS using OSS?
    a. (What are the points to watch out for? What is your stance on the "as-is, without warranty" nature of OSS used to manage OSS? What is your internal rationale for this?)
11. Do you have a process for internal development departments to submit requests to use software that incorporates OSS?
    a. (What does the application form include? What happens if there's a violation? Are there checks for violations after approval?)
12. [Raised on 2/10] What about contributions to the OSPO from the Legal Department or Intellectual Property Department?
    a. who is responsible for legal determinations?
13. [Raised on 2/10] Who is responsible for SBOM requirements during procurement?
    a. What is the responsibility regarding content, contracts, and cases where an SBOM is not submitted?
14. What issues does OSPO handle?
15. Why are OpenChain's activities necessary?
16. How should I identify vulnerabilities in OSS?
17. How should we engage with the community?

March 24, 2023 Meeting Chat

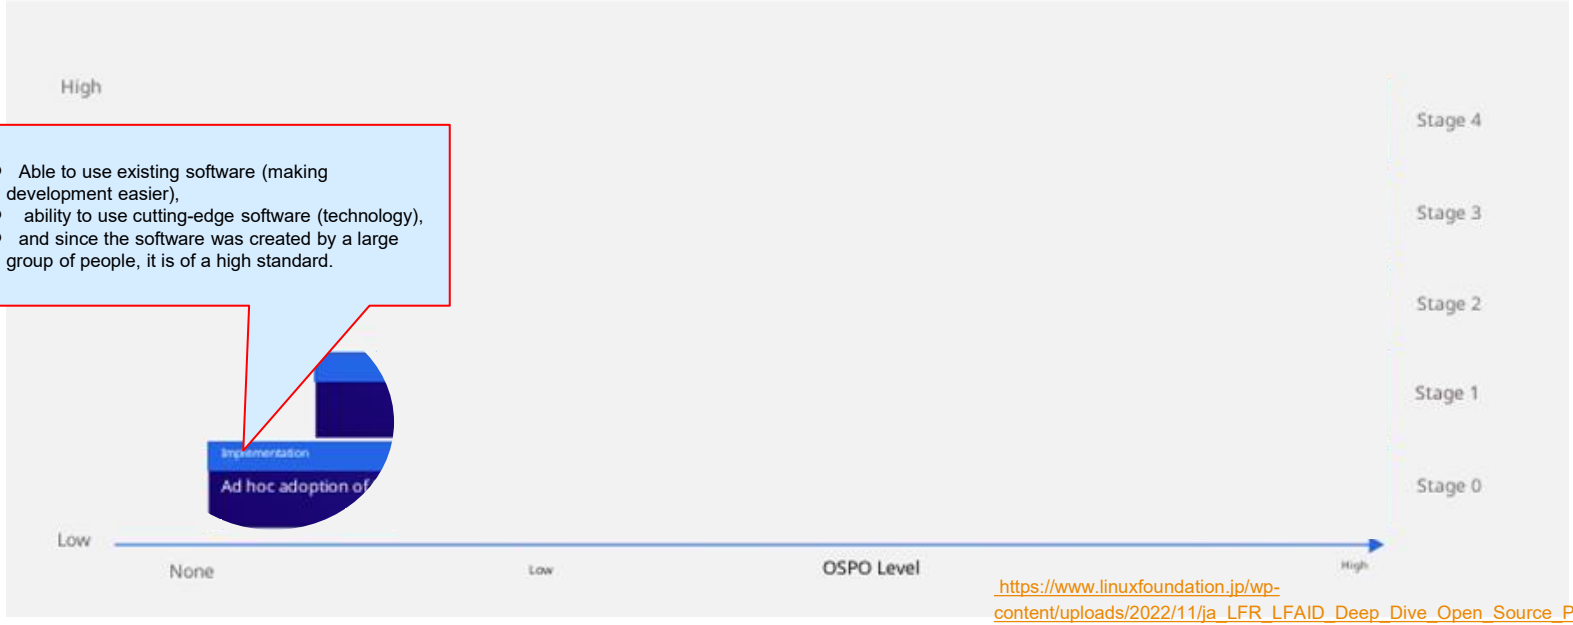

- 3:06:12 PM
- I imagine there might be a question like, "What is an OSPO in the first place?"
- 15:07:11
- I responded with "??" to "What is an OSPO, anyway...?"
- 3:07:45
- This is a white paper that lists the organizational structure in the TODO section.
- https://www.linuxfoundation.org/research/a-deep-dive-into-open-source-program-offices
- 15:07:47
- Here is a document I've seen before:
- In-Depth Analysis: "Open Source Program Office" Organizational Structure, Roles, Responsibilities, and Challenges By Linux Foundation Japan November 29, 2022
- https://www.linuxfoundation.jp/blog/2022/11/japanese-version-of-a-deep-dive-into-open-source-program-offices-launch/
- 3:10:42 PM
- I wonder if that document I saw a while back has disappeared...?
- https://www.linuxfoundation.org/resources/open-source-guides/creating-an-open-source-program?hsLang=en
- 15:13:07
- It's listed here
- 15:13:09
- https://github.com/todogroup/ospo-career-path/blob/main/module3/README.md
- 15:13:57
- https://github.com/todogroup/ospo-career-path/blob/main/OSPO-101/module3/README.md
- 15:14:15
- Is this it?
- 15:14:16
- https://github.com/todogroup/ospo-career-path
- 15:15:09
- https://www.linuxfoundation.jp/resources/open-source-guides/creating-an-open-source-program/#4
- 15:15:14
- It seems important to organize and list the information everyone has shared.
- 15:20:09
- https://www.linuxfoundation.jp/resources/open-source-guides/creating-an-open-source-program/
- This is it...
- 15:22:13
- OSS promotion, I suppose.
- 15:23:10
- Reacted to "OSS promotion, I guess" with ??
- 15:38:26
- I thought it might be easier to understand if "why" came first.
- 15:42:19
- It might be helpful to have OSPO maturity stages.
- 15:46:44
- https://www.linuxfoundation.jp/resources/open-source-guides/creating-an-open-source-program/#2
- It does seem like many people start at the very bottom in this role.
- 15:48:13
- At the end of the chat, be sure to click "Save Chat" to convert it to text and store it along with the meeting minutes.
- 15:48:36
- Reacted to "At the end of the chat, click 'Save Chat' to..." with ??
- 15:50:44
- What do you think of the content of the leaflet?
- 15:50:55
- Reacted to "What do you think of the content of the leaflet?" with ??
- 15:52:37
- I responded with ?? to "What do you think of the content of the leaflet?"
- 15:52:53
- Is it something like literacy?
- 15:54:14
- I've even explained it before by saying, "You'll end up becoming a thief."
- 15:55:53
- I think we should break down "executive order" a bit further and write something like "executive order requiring OSS supply chain management."
- 15:56:58
- I do remember saying "No More OSS Thieves" (as in movie pirates).
- 15:57:19
- The executive order is more about security than license management, isn't it?
- 15:57:27
- Reacted to "The executive order is more about security than license management..." with ??
- 15:57:52
- Reacted to "'No More OSS Thieves' (Movie Thieves...)" with ??
- 15:59:26
- He has also cited the Tokyo Olympics logo plagiarism issue as an example…
- 16:00:17
- Reacted to "Citing the Tokyo Olympics logo plagiarism scandal..." with ??

The Relationship Between the Benefits of OSS, the Role of the OSPO, and the Level of Understanding of OSS

- As understanding of OSS and the community deepens, perceptions of the benefits of OSS change
- and the role of the OSPO changes
- Steps Toward a Deeper Understanding of OSS:
  1. OSS = Software whose source code is disclosed and for which free copying, modification, and distribution are permitted
     - "It's a good deal because it's free"
  2. You must comply with license terms, such as copyright notices and license disclosures.
     - "We should thoroughly understand the license and ensure we comply with it."
  3. High quality, but no warranty
     - "We need to provide our own commercial warranty."
  4. The high quality is due to the involvement of many engineers in development and testing
     - Quality may vary depending on how many people are involved
     - "You should be familiar with the development community."
  5. If you do not contribute your in-house modifications to the community, you will no longer be able to support the product
     - Keeping fixes in-house ends up costing more than developing them from scratch in-house
       - To keep up with OSS version updates, you'll end up having to backport them in-house
       - If you give up on backporting, you won't be able to upgrade the OSS versions that are integrated with your in-house modified OSS
  6. Collaborating on fixes within the community yields better results
  7. Contributing helps invigorate and stabilize the community, making it easier to provide product warranties
  8. By taking a leading role in managing the OSS community critical to your product, you can differentiate your product

Ibrahim Haddad, **"A Deep Dive Into Open Source Program Offices: Structure, Roles, Responsibilities, and Challenges** " foreword by Chris Aniszczyk, August, 2022

Q: What are the benefits of utilizing OSS and engaging in OSS activities?

- Ability to use existing software (making development easier),
- ability to use cutting-edge software (technology),
- and the software is of a high standard because it was created by a large community.

- Ability to use OSS properly and with confidence in business,
- ability to use OSS in the manner intended for business-to-business transactions,
- and risk management for OSS usage across the entire supply chain.

- Compared to handling it in-house, having many engineers involved makes it easier to find bugs, and fixes are more accurate and faster,
- community collaboration leads to more efficient use of development resources,
- a platform for talent development, retention, and acquisition,
- and attracting talent by enhancing engineers' market value and providing opportunities for professional engagement.

What is an OSPO?
A summary of what an OSPO does at companies in each stage

Qx

- responsible for promoting company-wide compliance with licenses,
- a preparatory unit designed to help employees understand OSS culture and act appropriately within the company in order to effectively utilize OSS communities.
- With the long-term goal of contributing to external OSS communities, the team first focuses on sharing OSS information internally and building an internal OSS community to foster active interaction

- Responsible for raising awareness and promoting adoption of the license,
- activities aimed at promoting the importance of OSS and the need to comply with licenses.

https://www.linuxfoundation.jp/wp-content/uploads/2022/11/ja_LFR_LFAID_Deep_Dive_Open_Source_Program_Offices_0830.pdf

Ibrahim Haddad, **"A Deep Dive Into Open Source Program Offices: Structure, Roles, Responsibilities, and Challenges** ," foreword by Chris Aniszczyk, August 2022

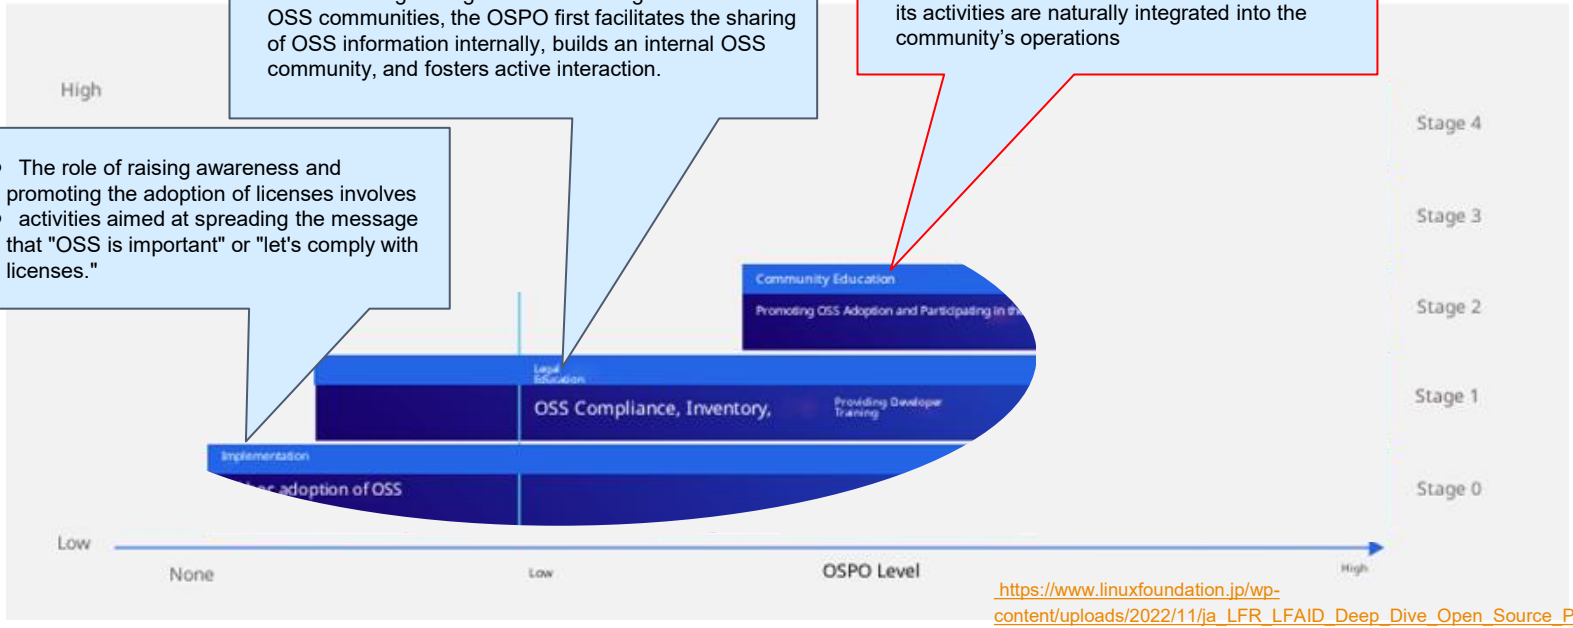

What is an OSPO?

Qx I've summarized what an OSPO does at companies at each stage

- The OSPO plays a role in promoting thorough license compliance across the entire company,
- a preparatory unit designed to help the company understand the culture of OSS communities and enable appropriate internal actions to leverage them.
- With the long-term goal of contributing to external OSS communities, the OSPO first facilitates the sharing of OSS information internally, builds an internal OSS community, and fosters active interaction.

- The OSPO serves as a bridge to help companies align with the distinct culture of open source, providing a framework for its smooth adoption and utilization;
- it is an organization that facilitates collaboration with OSS communities, groups, and organizations—which embody the distinct culture of open source—and aims to ensure that its activities are naturally integrated into the community's operations

- The role of raising awareness and promoting the adoption of licenses involves
- activities aimed at spreading the message that "OSS is important" or "let's comply with licenses."

https://www.linuxfoundation.jp/wp-content/uploads/2022/11/ja_LFR_LFAID_Deep_Dive_Open_Source_Program_Offices_0830.pdf

Ibrahim Haddad, **"A Deep Dive Into Open Source Program Offices: Structure, Roles, Responsibilities, and Challenges** " foreword by Chris Aniszczyk, August, 2022

- an OSPO is an organization that facilitates collaboration with OSS communities, groups, and organizations—which embody the distinct culture of open source—and aims to ensure that its activities are naturally integrated into the community's operations.

- Responsible for raising awareness and promoting the adoption of licenses,
- activities aimed at promoting the importance of OSS and the need to comply with licenses.

- One aspect of the OSPO's mission is to realize the principle that "community contribution equals company success."
- its role is to identify changes in industry culture and trends and update the company's internal culture accordingly

https://www.linuxfoundation.jp/wp-content/uploads/2022/11/ja_LFR_LFAID_Deep_Dive_Open_Source_Program_Offices_0830.pdf

Ibrahim Haddad, **"A Deep Dive Into Open Source Program Offices: Structure, Roles, Responsibilities, and Challenges** ," foreword by Chris Aniszczyk, August 2022

What is an OSPO?

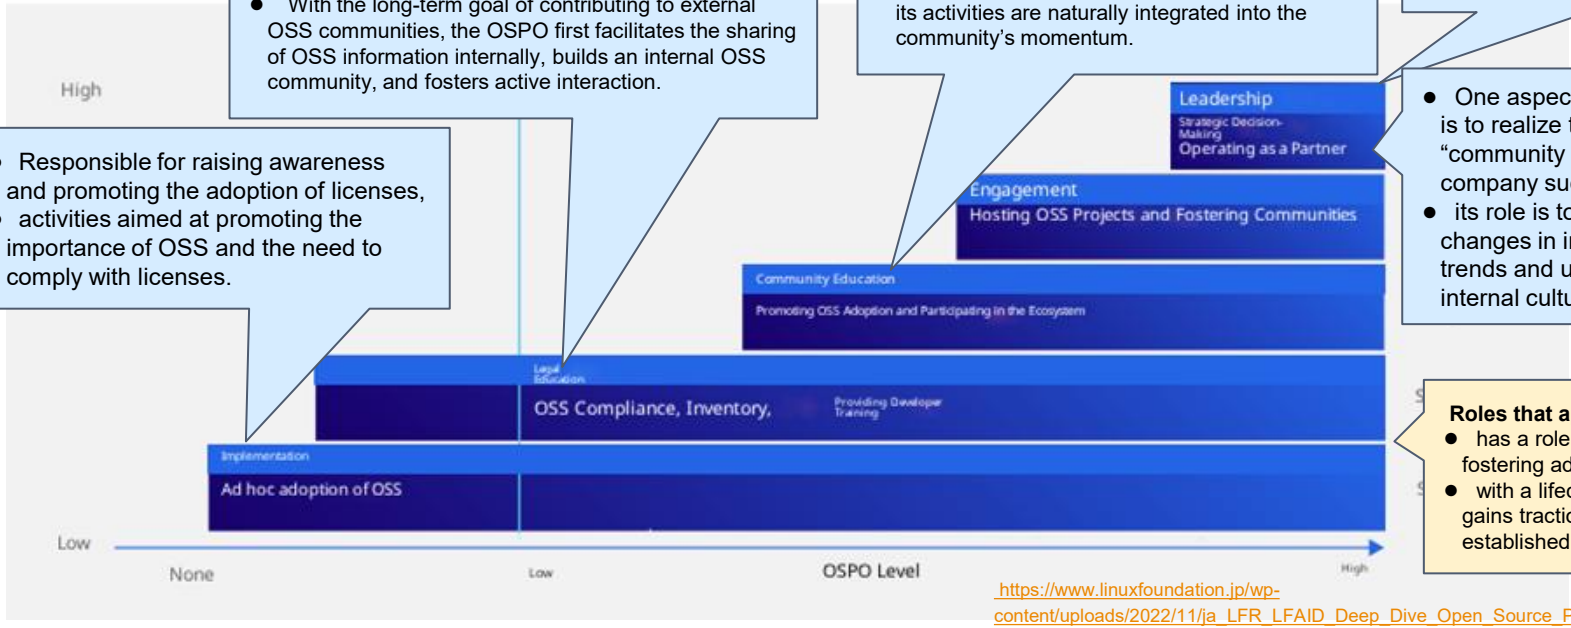

Qx I've summarized what an OSPO does for companies at each stage

- The OSPO is responsible for promoting strict compliance with licenses throughout the entire company,
- an office dedicated to preparing the company to understand the culture of OSS communities and act appropriately within the organization to leverage them.
- With the long-term goal of contributing to external OSS communities, the OSPO first facilitates the sharing of OSS information internally, builds an internal OSS community, and fosters active interaction.

- The OSPO serves as a bridge to help the company collaborate with the distinct culture of open source, providing a framework for its smooth adoption and utilization;
- it is an organization that facilitates collaboration with OSS communities, groups, and organizations—which embody the distinct culture of open source—and aims to ensure that its activities are naturally integrated into the community's momentum.

- The OSPO's role is to identify trends within the community, lead the community, generate new trends, and leverage them for the business
- and to work toward ensuring that these principles become firmly established as part of the corporate culture

- Responsible for raising awareness and promoting the adoption of licenses,
- activities aimed at promoting the importance of OSS and the need to comply with licenses.

- One aspect of the OSPO's mission is to realize the principle that "community contribution equals company success."
- its role is to stay abreast of changes in industry culture and trends and update the company's internal culture accordingly

Roles that apply regardless of stage

- has a role of raising awareness and fostering adoption
- with a lifecycle: it grows larger as it gains traction, then shrinks once it's established

https://www.linuxfoundation.jp/wp-content/uploads/2022/11/ja_LFR_LFAID_Deep_Dive_Open_Source_Program_Offices_0830.pdf

June 28, 2024 Agenda

1. Explanation of the Meeting Code of Conduct
2. purpose of this meeting
3. self-introductions & top concerns regarding OSPO
4. moving forward
    a. Should we wrap things up and share our results,
    b. and does this meet participants' needs?
5. select FAQ topics from the list of concerns for discussion

The OpenChain Project Japan Work Group / CC BY 4.0

Points of Interest

- We want to ensure people understand OSS correctly,
  - If internal rules aren't established based on a correct understanding, developers will face difficulties
- internal advocacy,
- and have people use OSS to streamline their work and focus on what really matters.
- Contribution activities are not properly recognized;
  - there is a lack of understanding that this is necessary for the company
- how to establish procedures that are feasible on the ground;
  - While listening to the self-introductions, I realized that the Linux Foundation (LF) provides the information needed to help people understand this, so I'm including a link:
  - Open Source Guide for Enterprises – The Linux Foundation
  - I'm also including the presentation materials from when I discussed examples of contributions made by NVIDIA, a semiconductor company, for business purposes:
  - https://static.sched.com/hosted_files/ossna2024/05/QuantitativeMethodContributionValue-KS_MK_202404.pdf
  - Intel's External Communications
  - How Intel Supports Open Source from the Inside Out
- who should be appointed as the executive in charge;
- how OSS can be leveraged for business;
- metrics for evaluating OSS activities;
- and making sure business units take ownership of OSS.
- The current situation with AI resembles the early days of OSS (e.g., "It's dangerous, so don't use it").
- Japanese companies tend not to take action without external pressure—is there a way to address this?
- We want to move beyond just governance and take a leading role.
- Cybersecurity has also come into the spotlight,
- there are varying levels of enthusiasm among departments within the company,
- there are issues with the process for adopting OSS (we want people to select secure OSS),
- recruiting OSPO members and determining what kind of people are needed,
- and whether the challenges facing OSPOs are different in Japan compared to overseas.

The OpenChain Project Japan Work Group / CC BY 4.0

- Has modern software shifted from being developed in-house to being procured?
- With cloud services becoming mainstream, the model has shifted to developing software as OSS and generating revenue through the service. Japan has not been able to keep up with this trend.
- Is this specific to Japan?
- Suggested FAQ Topics:
  - What is a contribution?
    - deepening understanding
    - how to communicate it
    - how to measure value
- Explaining OSS contributions in terms of standardization committee activities makes the concept easier to understand

The OpenChain Project Japan Work Group / CC BY 4.0

Idea Collection (July 26, 2024)

- Why Make OSS Training a Company-Wide Initiative?
  - Gather and share case studies from other companies
- Is there a common model for categorizing training content by level (basic, licensing, practical, strategic)?
  - training for management (mindset shift): effective approaches for department heads, section managers, and executive leadership
- How to get started: Where should we begin?
  - Use lightning talks (LTs) to gather and share ideas. I get the feeling there are differences within the industry.
- The ideal relationship between OSS communities and companies, and the reasons behind it
- EU countries and cities have OSPOs
  - The EU Commission is leading the charge: to counter U.S. Big Tech
    - Building systems for each local government has reached its limits | Hal Seki (note.com)
  - Wouldn't it be a good idea to raise awareness that OSS and OSPO are necessary for making money?
- I want to effectively communicate that community activities bring benefits to the company

The OpenChain Project Japan Work Group / CC BY 4.0

August 23, 2024: Regarding Contributions

- Contribution:
  - Examples: Reporting issues, reporting bugs, proposing fixes
  - creating documentation, participating in events, and actively helping to energize events
  - introducing and promoting the community through blogs, etc.
  - In general, anything that helps energize the community counts as a contribution
  - Donations (Sponsorship)
    - contributions to the project, events, or membership fees to the Foundation
    - providing goods or infrastructure
- why are contributions necessary and important?
  - To ensure your company isn't at a disadvantage: creating documentation, establishing a shared understanding
  - expanding the user base for our company's devices (in competitive areas)
  - As an SI provider, avoid vendor lock-in when developing software in-house
  - enhancing our company's presence to secure business deals
  - improving developer (employee) satisfaction ➞ increased sense of belonging, attracting developers
    - From a recruitment perspective, identify and hire individuals who are active in the community
  - Development and Technology
    - utilize the community as a platform for solving technical challenges (improve performance and functionality to enhance the competitiveness of our products)
    - control development costs by keeping pace with security updates (by contributing to OSS, we can minimize differences from the latest versions and thereby reduce costs)
  - increasing individual engineers' professional value: their achievements are publicly documented
- That said, regarding issues where it's difficult to gain buy-in
  - De facto standards are established through OSS.
  - It's easier to gain buy-in if you can map the current OSS model to past successful models.
  - Inability to effectively demonstrate how the money spent will yield returns ➞ this is difficult without a top-down approach.
  - If OSS is viewed merely as a software development activity, it becomes difficult to justify the costs.
  - How to convey that the idea of "someone else will do it even if we don't" is outdated:
  - effectively communicate the success stories of other companies.
  - Instead of looking for workarounds to problems, gather collective wisdom to find fundamental solutions.

The OpenChain Project Japan Work Group / CC BY 4.0

October 18, 2024 Local Meetup

- How to convince departments unfamiliar with OSS
  - Explaining that we're no longer operating in a closed-off manner: the work remains the same
  - We often get the response: "Even if you're no longer keeping it in-house, keep as much of it as possible within the company."
    - I want to convey that this is futile resistance, but how can I get the message across?
  - The concept of giving back
  - OSS is not a competitive arena; there's nothing to lose. In fact, there's much more to gain.
  - Exchanging outdated versions of OSS across the supply chain is causing fragmentation.
- and companies unfamiliar with OSS
  - The fundamental challenge is that they lack the concept of "open" to begin with.

The OpenChain Project Japan Work Group / CC BY 4.0

November 22, 2024

- What will the OSPO ultimately look like?
  - Continue with maintenance and support
  - it's better to have an OSPO when launching new initiatives
  - once each department is able to appropriately utilize OSS and engage in community activities, many of these roles will become unnecessary
  - Open Source Summit Europe 2023: Workshop: Building and Managing an Open...
    - Around the 53-minute mark of the video, there's a discussion on the OSPO Lifecycle.
  - Will the OSPO remain as a mechanism to monitor whether OSS contributions are being made appropriately?
    - Isn't it impossible to determine whether it's appropriate without comprehensively examining various internal evaluation metrics?
    - It is difficult to quantify the value of OSS activities (including contributions) to the company (CHAOSS activities).
  - PMOs still exist. Shouldn't the same be true for OSPOs?
  - Won't the educational function continue to exist?
  - Wouldn't this vary depending on the industry and business in question?
    - For companies where OSS is necessary across all departments, the OSPO will be phased out—its functions will be distributed among existing organizations
  - Shouldn't the OSPO be eliminated?
    - Won't OSS become the norm (packaged software), meaning everyone will need to be able to use it as a matter of course?
    - Should the OSPO become part of the PMO?
  - Open Source CEO: Interview with Red Hat's Jim Whitehurst | TechCrunch Japan Archive
    - "Ultimately, every company will move toward open source," Whitehurst stated unequivocally.
  - The culture and form of OSS are evolving: Isn't a specialized organization needed to keep up with this?

The OpenChain Project Japan Work Group / CC0-1.0

- Shouldn't OSS contributions be monitored as an obligation?
  - Given how dependent we are on OSS
  - it's not good to overemphasize that "free riders are unacceptable."
    - "If you become a free rider, you'll get what's coming to you" is a message that's easier to accept
  - there's also the issue of training engineers
  - https://gigazine.net/news/20241110-open-source-maker-taker-problem/
  - "Post Open provides a way to compensate them for their work. We believe that Post Open can address the issues facing open source, tackle these problems, and build a healthier community that achieves the goals open source is failing to meet today."
    - What Comes After Open Source? Bruce Perens Has Some Ideas - The New Stack
  - just as with ESG practices, it would be good to make the level of OSS contributions visible to the public so that it becomes a factor in corporate evaluation.
    - what about the idea—similar to CO2 reduction efforts—where companies come together to decide how to share the burden of contributions?
      - or perhaps companies could buy and sell their contribution shares among themselves.
  - within a company, prioritize contributions and select where to focus efforts
  - OSCI

The OpenChain Project Japan Work Group / CC0-1.0

January 24, 2025

- Returning to basics: compiling frequently asked questions and summarizing the answers:

- who (which internal department) should run the OSPO?
- Which internal departments (or functions) does the OSPO encompass?
- Is the OSPO responsible for security response?
- Is the OSPO responsible for managing the SBOM?
- Is the OSPO's role limited to internal activities?
- Should we leave OSS-related matters to the OSPO?
- Does the OSPO make decisions regarding OSS licenses?
- Does OSPO need to be aware of how OSS is being used within the company?

The OpenChain Project Japan Work Group / CC0-1.0

January 24, 2025; February 28 – March 28 (Tentative Fix); April 25 (Final Fix)

- Does the OSPO also need to be responsible for security measures?
  - Reference: 2024 State of OSPO and Open Source Management - The Linux Foundation (Page 24)
- Answer:
  - The primary scope of the OSPO is strictly open source, whereas security responses encompass non-open-source areas as well. Therefore, it is difficult for the OSPO to serve as the primary point of contact for security responses; typically, the security team handles these matters.
  - However, it is considered best practice for the OSPO to collaborate with the security team—for example, by providing information regarding open-source security issues.
    - Since more than 98% of all products and systems in the world utilize OSS (Open Source Security & Risk Analysis Report (OSSRA) | Black Duck), and addressing OSS is essential for security, there is an increasing number of cases where OSPOs are involved or take the lead.
      - There are many areas where OSPOs are involved, such as discussions in various OSS communities on topics like OSS vulnerabilities, SBOMs, international standards, and regulations.

The OpenChain Project Japan Work Group / CC0-1.0

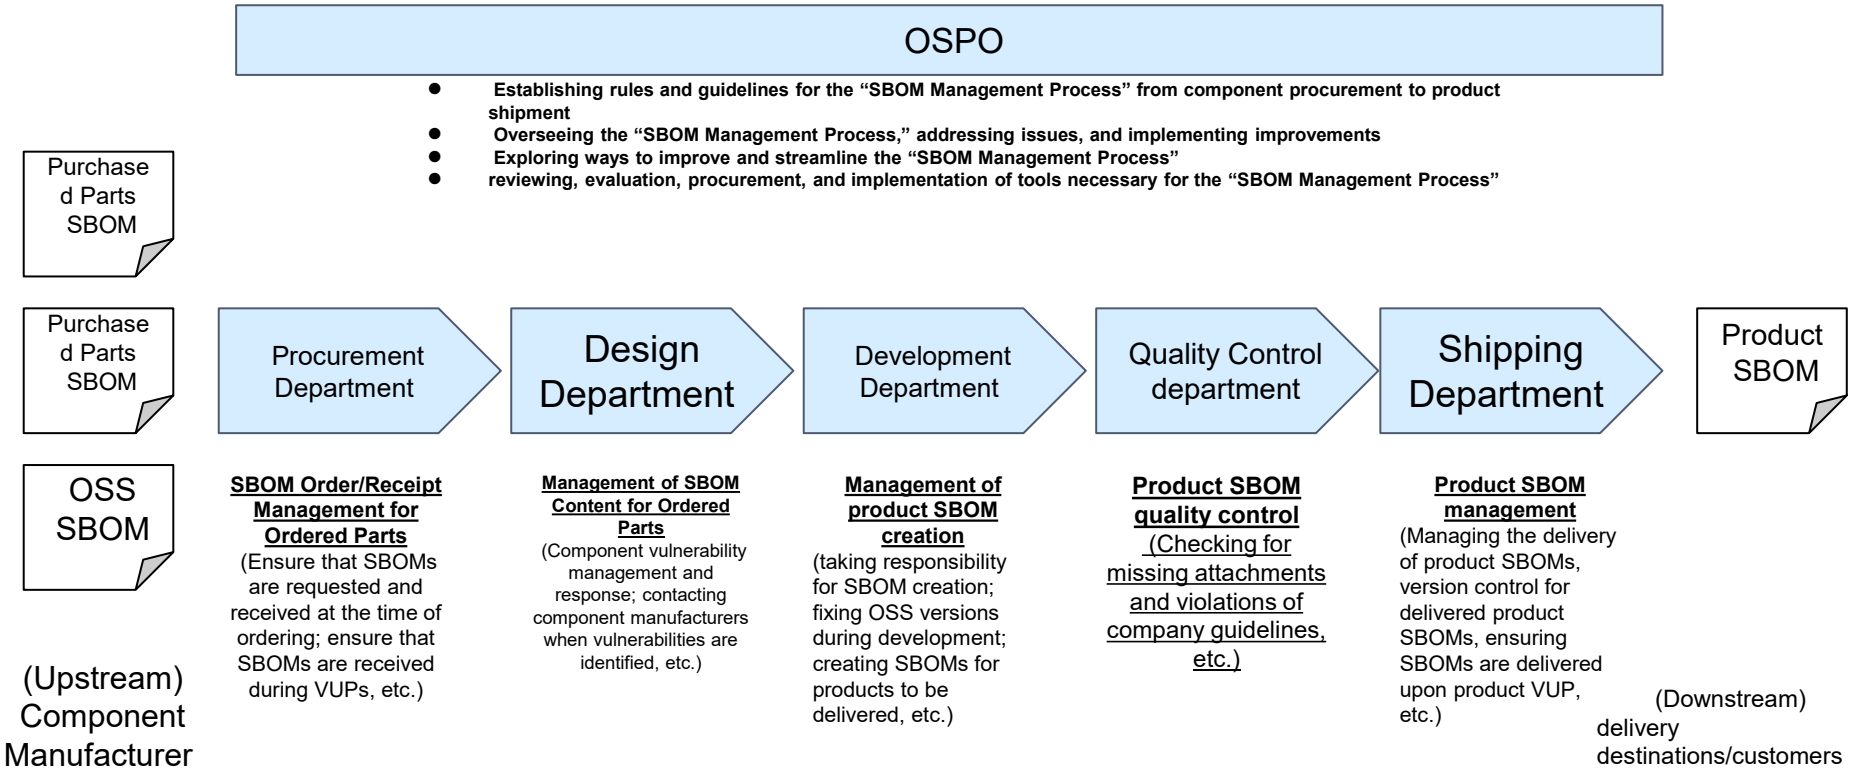

- Is the OSPO responsible for managing SBOMs?
- Answer
  - Since SBOMs are used to manage the components of software in general, they are managed by software development departments rather than the OSPO.
  - Since SBOMs are exchanged between organizations in the supply chain and among departments within a company, it is necessary to ensure a coordinated approach rather than having individual development departments handle them separately.
  - Therefore, the OSPO may sometimes serve as the coordinating body.
    - There may be companies (or individuals) who would be concerned if this statement were interpreted in the wrong way: it's best to be careful with the final wording.
  - As a path toward assuming a coordinating role, one approach is to establish a central point of contact where all internal discussions converge.
  - OSPO's expertise may be sought for establishing rules and promoting adoption.
    - Discussions regarding SBOMs are still ongoing in open-source communities and elsewhere, making the OSPO's role as a "bridge between the community and the organization"
    - increasingly important
    - Random thought: If I phrase it as, "Please share best practices and typical cases regarding the OSPO's involvement with SBOMs," I wonder if that could also be used to explain the current state of SBOMs.
  - The OSPO drives efforts until SBOM management becomes firmly established within the company
  - OSPO often handles SBOMs for proprietary software as well.
  - I don't think it's possible to prepare an SBOM without OSPO's involvement
  - Since the information obtained from SBOMs serves as input for OSS strategy discussions, it would be beneficial for the OSPO to actively engage with SBOMs
    - The perceived value and uses of SBOMs vary depending on the maturity stage of OSS
  - the OSPO (or its predecessor) used to handle SBOMs (or something similar) for OSS compliance,
  - but since there are different levels and stages even within SBOMs, wouldn't the answers vary accordingly?

3/28

- Aligning SBOM Concepts:
  - Software Bill of Materials:
    - there is variation in component granularity, criteria for what to include or exclude (e.g., whether it is OSS), and formatting
  - for items that have become machine-readable,
    - there is some variation in format, ID conventions, and other aspects.
    - Some people may view this as an SBOM that does not prioritize machine-readability, right?
      - For example,
    - it would be interesting to explore this from both perspectives:
  - purpose of use, use cases.
    - Don't priorities differ depending on the company or perspective?
- those who believe an SBOM (for tracking components) is necessary are the ones responsible for the product
  - The OSPO's role is to define the de facto SBOM (purpose, tools, format, processes, etc.) established by the community within the company, and to communicate and promote it
  - As part of the OSPO's role as a "bridge between the community and the company," it also promotes the sharing of feedback from the company to the community and works to ensure the SBOM becomes better for both the community and the company

The OpenChain Project Japan Work Group / CC0-1.0

I’ve organized the “SBOM Management Process” I mentioned in the comments section on May 23 into a diagram
and would appreciate any advice or comments

The OpenChain Project Japan Work Group / CC0-1.0

Chat notes from May 23 (excluding speaker information)

- There was a discussion about it not being profitable, but based on the information shared on Slack, I think Japan needs to pursue OSS activities to the point where they become profitable.
- I get the impression that when the main driver of OSPO-style activities is within a profit center, it tends to be harder to justify community involvement.
  - I imagine there are various factors contributing to this.
- Since the stage of development varies by business unit within the company (including group companies), it's quite challenging to figure out how to frame this as "group-wide activities."
- It happens quite often, albeit rarely. > "Let the OSPO figure that out"—that kind of passing the buck
- I thought the question "Is the OSPO responsible for managing the SBOM?" might cause confusion because it could also imply "Does the OSPO bear responsibility for the SBOM?"...
- We're currently discussing this very issue internally. Since we don't have the resources to handle each case individually, we're planning to establish the OSPO as the central point of contact for SBOMs across the entire company.
  - We're still figuring out how to handle the inquiries we receive...
- I think the (development) teams will expect someone else to handle it if that's the case. We'll need to clarify roles and responsibilities, won't we?
- We agree that "creating" and "submitting" the SBOM are the developers' responsibility, but from the developers' perspective, we'd be happy if there were guidelines for automating this within CI/CD—or even better, if it were already implemented (like on GitHub).
- I don't believe the OSPO at my previous job had responsibility for managing SBOMs.
  However, its role was to manage "best practices" and "platforms" related to OSPO, including SBOMs
  - (not managing the SBOM itself).
- If there is a department similar to a PSIRT (such as a security department or procurement department), I believe that department should take the lead on SBOMs rather than the OSPO.
- When it comes to automation, the requirements for SBOMs used within an organization should be standardized, and in this sense, I believe the TelcoWG's SBOM guide serves as a useful reference for my industry as well. I personally believe the OSPO should take the lead on this (though we haven't reached a consensus within our company's OSPO team yet).
- Replying to "If there is a department like PSIRT (security department? or procurement department?), that department should take the lead on SBOMs rather than the OSPO...":
  Could you explain a bit more about why you think that?

7/11

- As OSPO matures, it will become an organization that demonstrates expertise and leads discussions regarding OSS-related responses.

Below are chat notes:

- Assuming the procurement department only verifies formal compliance, if another department (such as the security department) handles vulnerability management using that software, I think that should also be included in this workflow.
- I'll check to see if there are any blank fields.
- There's actually quite a bit of variation in the functions performed by OSPOs, even within the same industry. Examples from four companies in the automotive industry can be found here in AGL's Publications.
  - https://lf-automotivelinux.atlassian.net/wiki/spaces/OSPO/pages/397082627/Publications#OSS-%26-OSPO-Promotion-Slides-for-Automotive-Companies
  - It's called "Showcase."
- Looking at the table in the document above, SBOM management falls under "Compliance," but you can see that the classifications vary between "Leading" and "Support."
- Or maybe the person in charge of procurement, ordering, and development is actually the same person...
- Is this the "SBOM is different from the BOM we know" problem?
- Doesn't it seem like the OSPO is involved because, based on experience, they know that "if we don't get involved early and maintain a certain level of control, decisions will go in the wrong direction and we'll face difficulties later"?
- It's not that influencing other departments is important; rather, if it's necessary to ensure that an item that enhances the value of OSS (the SBOM) is managed correctly, then taking the "Leading" role is the right approach, isn't it?
- Sorry, I haven't been able to participate in the current discussion. From my perspective, it feels like, "I wonder if such an ideal, utopian world even exists?"

8/22

- One of the OSPO's roles is to help the organization adapt to changes brought about by OSS. So, regarding security, there's also the view that once a dedicated department is established and functioning effectively, there will no longer be a need for the OSPO to be involved.
- Will the OSPO's activities expand beyond OSS? ➡ YES
  - In the sense of effectively engaging with external changes and activities, the Program Office for open initiatives = Open Collaboration Program Office
- The individual business units (departments) take the lead, and the OSPO provides support
  - The OSPO is responsible for company-wide coordination and pioneering initiatives
  - Fostering and advocating for core engineers is likely also part of the OSPO's role
- The risk of linking OSPO's operating budget to business performance
  - Since being connected to the open world is the foundation of OSPO's activities, certain activities must be maintained
  - This should be viewed as an investment; cutting back based on performance is not a good idea. Without continuity, there can be no growth.
  - If we can gain understanding that OSS activities are closely tied to the business and demonstrate tangible results, the situation will stabilize

The OpenChain Project Japan Work Group / CC0-1.0

8/22

- Among the various initiatives handled by the OSPO, is it the case that those considered important from a business or governance perspective by business units or the company itself should be transferred to and managed by separate organizations? If so, it might be worth considering which initiatives could be candidates for such a transfer.
  - I think items that directly benefit a business should be transferred to that business unit.
  - Things that only the OSPO can do are things the business units haven't considered yet but will need in the future,
    - securing a certain number of engineers and personnel capable of handling OSS, and maintaining that culture.
  - I think it would be best to consolidate the OSPO's OSS strategy planning and promotion functions within the company-wide management strategy.

The OpenChain Project Japan Work Group / CC0-1.0

- Isn't it often the case that understanding of OSS ends up resembling the fable of "Blind Men and an Elephant"?
  - (Comment) Since the moral of "Blind Men and an Elephant" varies by country, we'll need to be careful when using it in global contexts

The OpenChain Project Japan Work Group / CC0-1.0

9/19

- What is OSPO?
  “A group that works to ensure corporate activities adapt and align with the changes brought about by OSS”
- The desired state of adaptation varies by company, and therefore the activities (and form) of an OSPO will differ (Your OSPO is not My OSPO)

The OpenChain Project Japan Work Group / CC0-1.0

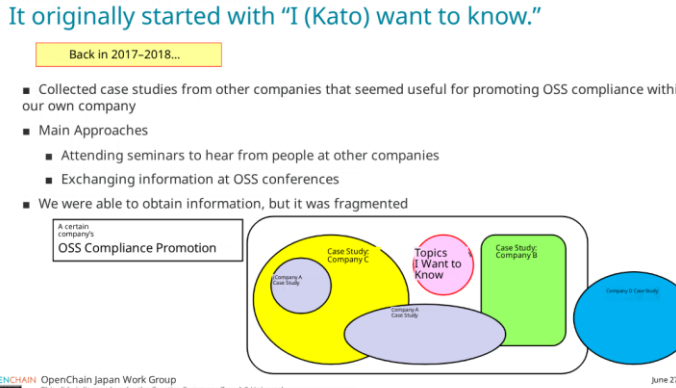

- The “target state” may vary depending on one’s position within the company
  - For example, management focuses on risk mitigation; R&D aims to accelerate innovation; product development focuses on efficient compliance; and OSPO focuses on business strategies that include collaboration with OSS and community activities, etc.
  - this is thought to stem from a lack of consensus regarding the understanding of OSS
  - (Comment) bridging these differences may be the role (definition) of the OSPO

The OpenChain Project Japan Work Group / CC0-1.0

- The activities of an OSPO also vary depending on how it is launched
  - Until around 2020, the mainstream approach was for a group of volunteers—driven by a sense of urgency that OSPO (or similar activities) was essential for a company's growth and survival—to launch an OSPO as a grassroots initiative, which gradually gained recognition as an official activity (Bottom-Up OSPO).
  - in recent years, as the recognition that an OSPO is necessary has spread throughout the industry, there have been cases where OSPOs are established as a management decision (Top-Down OSPO)
    - (Comment) Do such cases actually exist? I'd like to know of some real-world examples.
  - Isn't it true that Bottom-Up OSPOs tend to aim for an OSS strategy, while Top-Down OSPOs tend to align with the goals set by senior management?
    - If senior management views OSS as a risk, governance is likely to take precedence, and contributions to the OSS community may take a back seat.
    - Ultimately, doesn't it depend on whether senior management understands how the OSS community operates and how the company should position itself within it?
    - I think there's a big difference between whether the software side is driving major technological trends or merely responding to specific customers.

The OpenChain Project Japan Work Group / CC0-1.0

- Could the situation described above be a factor preventing OSPO activities from progressing smoothly?
- Wouldn't it be helpful to have industry-specific guidelines (?)?
  - A collection of best practices (?)
- Do OSPOs tend to be somewhat similar depending on the type of business activity?
- When launching an OSPO, knowing that competitors in the same industry have one can be a useful argument for persuading internal stakeholders ➞ Is there a way to gather this information?
  - this is how my Lightning Talk at the OpenChain meeting began

The OpenChain Project Japan Work Group / CC0-1.0

10/24

- A recap of LF Japan Community Days,
- discussion on questions,
  - Challenges in activities aimed at Level 1 (what kind of structure should be established?)
  - how much foundational capability is required to tackle Levels 3 and 4?

- how the company should make decisions regarding licensing compliance at Level 1,
  - Deepen collaboration and communication among legal, IP, and engineering teams to mutually enhance understanding of legal provisions, software architecture, and practical operations, and reach a conclusion.
  - Leverage the findings and discussions from the OpenChain FAQ.
- and the foundational capabilities required for Level 3 and 4 activities.
  - Without individual engineers' motivation, this effort won't last. We need to create an environment where motivated individuals can take the initiative.
  - It's impossible without the company's endorsement. The company's policy on OSS contributions is crucial.

The OpenChain Project Japan Work Group / CC0-1.0

November 28, 2025

- How do companies handle internal rules regarding the use of OSS?
  - Sale of products incorporating OSS
  - distribution of applications incorporating OSS
  - Using OSS in software to provide services via the cloud (without providing the software itself)
- information sharing
  - We confirm which OSS to use before development begins
    - Rather than being strictly an internal rule, this is largely a matter of best practices and literacy, as it can be difficult to address issues after the fact (which could lead to license violations)
    - Depending on each company's level of literacy, I think operations can be managed somewhere between enforcing strict rules and leaving it up to individual team members
  - Ways to prevent the piecemeal use (snippets) of OSS
    - First and foremost, educating engineers is crucial. It's also necessary to raise the skill level of everyone in the supply chain.
  - Tools are convenient, but they often make mistakes. However, trying to check everything places a heavy burden on the team
    - It is up to each company to decide what level of oversight to implement.
    - You cannot hold tool vendors liable for issues such as license violations.
      - Mightn't there be a difference in how responsibility is assigned internally depending on whether OSS tools or major commercial tools were used?
  - Who is responsible for issues with the OSS itself?
  - Once you start using generative AI,
    - Note: GitHub (Microsoft) has a compensation program called the "Copilot Copyright Commitment" for AI-generated code. (If anyone knows the details, please explain.)

- The Relationship Between Tool Selection, Liability, and Justification:
  - Discussions regarding the level of pre-release product checks and handling external inquiries:
    - explaining to approvers, “Since we’re using this widely adopted tool, we believe it’s sufficient.”
    - Commercial tools are preferred over OSS tools due to the trust approvers place in them
      - Since OSS tools do not require approval, they often go unnoticed
    - It will likely be the OSPO’s role to ensure that approvers understand the situation clearly and without misunderstanding
    - When it comes to fulfilling accountability, commercial tools are easier because they come with built-in support. With OSS tools, we have to provide explanations ourselves (since we use them at our own risk)
  - Ultimately, the decision will be based on balancing the expected frequency of issues against the cost of countermeasures, so it will be determined by taking into account each company’s business model and scale
    - It might be helpful if this OSPO Sub-WG could propose a tool selection algorithm and evaluation formula
    - OSS maturity will likely also be a factor in determining which tool is best.

- Generative AI and OSPO
  - OSS governance and the governance of generative AI usage are similar: similarities in best practices

February 27, 2026

- Checkpoints for Selecting an SCA Tool
  - Software Composition Analysis Tool:
- distinguishing based on SCA tool output,
  - tools that identify and list the software components included,
    - identify components and list their names, licenses, copyrights, etc.
    - The method for identifying components varies depending on the tool and its options.
  - Tools that identify and list patterns in license statements, copyright information, and legal keywords related to licenses in the software being scanned (e.g., FOSSology)
    - identify and list the directories containing information indicating the license.
      - If the directory structure and naming conventions are appropriate, component-license pairs can be created.
- differences in scanning methods,
  - Cross-referencing the OSS database with the target software,
  - identifying patterns in the license text, copyright information, and legal keywords related to licenses in the software being scanned.
  - Use AI to compare the target software with an OSS code database, and perform accurate analysis while also utilizing AI-based code analysis (Reference: https://semcl.one/)
    - where the accuracy of snippet detection appears to be high.
  - Binary Scan:
    - determines a match by comparing symbol names in the symbol table with symbols in the database,
    - and examines the similarity of binary code patterns (fingerprints).
- and candidate checkpoints.
  - If the repository's directory structure is well-organized, keyword search types can also be useful;
    - if developers using OSS are well-trained and follow best practices, this type of tool may be sufficient.
  - If discovering code snippets is a priority, choose a tool with a component detection algorithm suited for that purpose.
  - Each company will likely have its own specific checkpoints depending on its ultimate purpose, workflows, and where in the process the tool is used.

The OpenChain Project Japan Work Group / CC0-1.0

- Accuracy
  - Accuracy increases when source code is managed properly
  - situations requiring binary scanning,
    - when receiving a binary release,
    - or when you want to know how the code appears to the release destination,
    - to check if any unintended source code has been compiled
    - or if unintended external libraries have been linked:
  - SCA tools cannot guarantee 100% accurate scan results.
    - It's better to consider improving accuracy by combining various methods—not just SCA tools, but also coding practices and code formatting tools
- binary scanning methods
  - to identify issues by analyzing characteristics and patterns, such as symbol names.

The OpenChain Project Japan Work Group / CC0-1.0

- What to do when a violation is pointed out by an external party
  - Example of a potential report:
    - “Aren’t you using a GPL software called XXX? Please provide the source code.”
    - Who will receive the report?
      - ① An OSPO-type department, ② the company’s inquiry desk, ③ the support desk for that product, ④ via a public repository, ⑤ information circulating on external social media, ⑥ an employee being consulted privately by an external party
  - Action:
    - It is necessary to ensure that anyone who receives an inquiry or information promptly notifies the appropriate internal department (OSPO).
    - Investigate whether XXX is actually being used
      - Identify and confirm with members of the project that developed (or handled) the relevant product
      - Investigate product-related records (stored source code repositories)
      - If third-party software is integrated, contact the respective vendor
    - Scan the product’s binaries to verify
    - If it is determined that XXX is not included:
    - If it is confirmed that XXX is included:
      - First, consider whether the source code can be provided
      - If you are unable to provide the source code:
        - Technical measures
          - » Suspend product sales
          - » Modify the product to exclude XXX and resume sales
        - Business-side response
          - » Acknowledge the violation and discuss a resolution with the rights holder
  - It is important to take precautions from the early stages of development to prevent such issues from occurring in the first place
    - by exercising caution throughout the entire supply chain, including externally sourced components
    - which is also an important role for the OSPO

The OpenChain Project Japan Work Group / CC0-1.0

April 24, 2026: What would happen if there were no OSPO?

- Responses to external inquiries would be delayed → This could lead to major issues, such as lawsuits
  - It's unclear where in the company inquiries will land, but if the person who receives them isn't familiar with OSS, they'll be ignored.
  - Now, if you ask an AI, it will alert you to potential risks,
- there is no consistent company-wide response. Responses vary by department and on a case-by-case basis,
  - increasing the risk of using OSS that infringes on the company's own patents (IP?).
  - Responses become dependent on specific individuals.
- we'll be unable to manage SBOMs and other requirements, fail to comply with legal regulations (such as the CRA), and business operations will stall.
  - we only realize the problem once it becomes an issue,
- If legal or IP departments lacking open-source expertise take the lead, the result will be a blanket ban on OSS use
  - and the company loses its competitive edge.
- Even non-IP companies will become unable to address supply chain risks
  - In cases where software is procured from external sources to support core business activities, even if those activities are not the company's primary business
  - In cases where a company handles software or products containing software but has no in-house engineers, there is no one within the company who can identify the risks
  - ➡ Perhaps there are many companies that never find the right moment to establish an OSPO—or even if they want to, are unable to do so?
  - Sometimes companies realize the need for an OSPO after receiving inquiries about OSS from related parties (such as contractors or business partners)

The OpenChain Project Japan Work Group / CC0-1.0

June 5, 2026

- CRA and OSPO
  - There are areas where the OSPO should—or would be better off—being involved in CRA compliance.
    - What is the best way for them to be involved? In a supervisory role? Or a supportive one?
  - At many of the participating companies, the OSPO is involved in CRA compliance, but at some, this is not the case.
    - "We're not quite at that stage yet."
    - It is important for the OSPO to coordinate with the corporate CRA (security) department.
    - It would be beneficial to raise awareness of the value of working with various internal departments—such as Legal and Quality Assurance—to find the right balance.
  - Rather than taking a leading role, the OSPO should function as a hub connecting internal and external stakeholders.
    - The OSPO functions effectively by staying close to the front lines, and its involvement is beneficial.
  - OSPO's approach to collaboration with other companies differs from that of other departments.
  - We want a baseline, but I feel that making it too rigid isn't quite right.
    - OSPO's collaboration with other companies is well-suited for "gaining a sense of the situation."
  - Why has OSPO's approach to collaboration with other companies emerged?
    - Since it's OSS, we can have in-depth discussions without handling confidential information. We can tackle common challenges.
    - This has helped build trust in some areas.
  - Currently, the community is gradually establishing a standard approach to CRA compliance.
    - It is currently difficult to gain internal understanding regarding how OSPO should build collaborations with other companies.
    - Traditional approaches remain effective as a means of countering regulatory authorities

The OpenChain Project Japan Work Group / CC0-1.0

July 3, 2026

- Open Source AI
  - The model is open, the code that runs the model is open, and the provenance of the data used to build the model is open (the data itself does not need to be open)
- Steward Strategy
  - by becoming a Steward, wouldn't it be effective, as an OSS project, to bring together manufacturers—who are users—as project members?
  - A Steward's obligations aren't that burdensome, are they?
    - Reporting obligations and cooperating on countermeasures.
  - It would be good to communicate the significant benefits manufacturers gain by participating in the OSS project,
  - and it would be helpful to provide a guide on how to participate.
  - As understanding of the value and benefits of Maturity Stage 3 grows, OSS activities will likely expand, with the Steward serving as a catalyst

The OpenChain Project Japan Work Group / CC0-1.0

7/24

- Benefits of becoming a Steward
  - Article 13 : "Obligations of Manufacturers" . Section 6 states the following, which means we can expect cooperation from manufacturers who are also users
    - If a vulnerability is discovered in a component, the manufacturer or administrator of that component must be notified
      In accordance with Part II of Annex I, implement measures to address the vulnerability
      Share the code and documentation for any software or hardware fixes implemented as a remedy with the manufacturer or manager of that component
    - Manufacturers shall, upon identifying a vulnerability in a component—including an open-source component—that is integrated into a product containing digital elements , report the vulnerability to the person or entity manufacturing or maintaining the component, and address and remediate the vulnerability in accordance with the vulnerability handling requirements set out in Part II of Annex I. Where manufacturers have developed a software or hardware modification to address the vulnerability in that component, they shall share the relevant code or documentation with the person or entity manufacturing or maintaining the component, where appropriate in a machine-readable format.
- will likely be the next topic: the preferred form of communication between manufacturers and stewards.
  - For example
    - we'll decide to raise an issue whenever a vulnerability is discovered
    - and submit a pull request (PR) proposing a fix

The OpenChain Project Japan Work Group / CC0-1.0

7/24

- Even if manufacturers have not been involved in OSS activities until now, might the CRA serve as a catalyst to generate motivation for them to engage in OSS activities?
  - Their literacy regarding OSS practices will improve, and they will take steps to foster this, etc.
  - as manufacturers strive to ensure their OSS components comply with CRA, they will naturally move on to Stage 3,
  - which means CRA will play a role in revitalizing OSS activities,
- If manufacturers are using outdated, unmaintained versions and a vulnerability that is being exploited is discovered, they will have the following two options:
  - such as forking the code and addressing vulnerabilities themselves,
  - migrating to the latest version,
- If manufacturers assume that the OSS community will address the issue if they report it, the community will need to proactively communicate with them
- Next:
  - and I'd like to discuss how to establish an appropriate relationship between manufacturers—who intend to take only minimal action—and stewards.

Is it safe to assume that manufacturers always understand that it is effective to announce OSS-related CRA vulnerabilities through the community?

The OpenChain Project Japan Work Group / CC0-1.0

8/28

- How to Establish an Appropriate Relationship Between Manufacturers and Stewards When Manufacturers Intend to Take Only Minimal Action
  - Survey results indicate that awareness and understanding of the CRA are still lacking
    - https://openssf.org/wp-content/uploads/2026/06/2026_CRA_Awareness_Readiness_Report.pdf
  - It is necessary to tailor the explanation based on the listener's level of understanding
- I sense a danger in the prevailing trend that, under the CRA, the OSS side is expected to accommodate the corporate side
  - otherwise, this will only contribute to maintainer burnout
  - It might be a good idea to write hypothetical scenarios of what could happen and present them at an event.

What is an OSPO?
Qx I've summarized what an OSPO does at companies at each stage

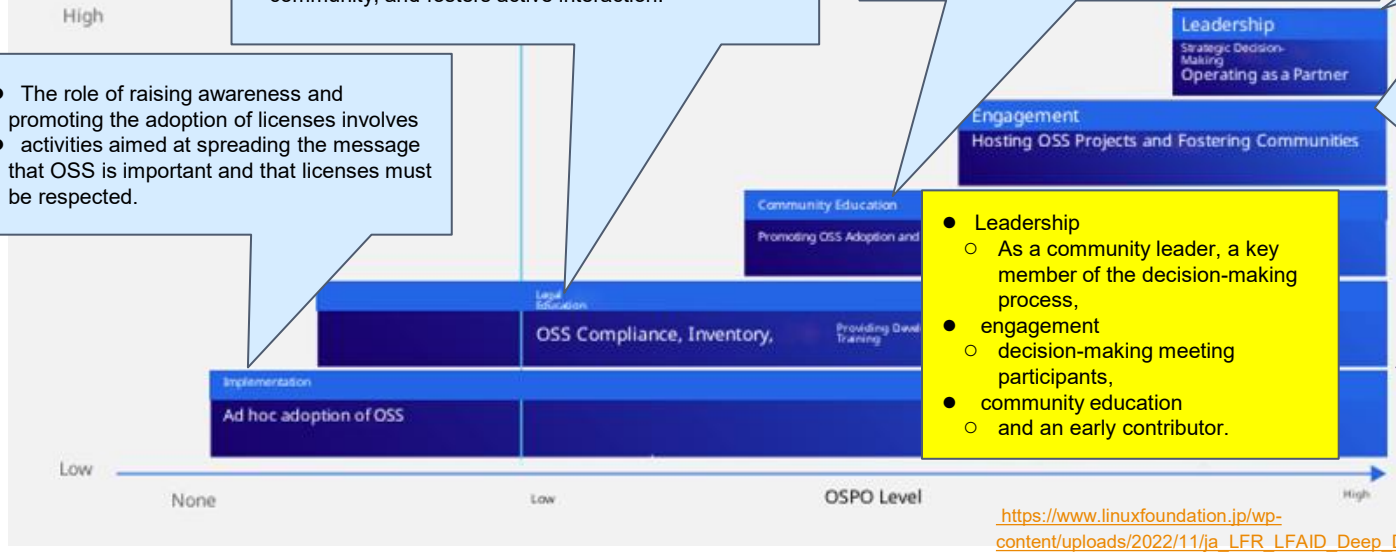

October 27, 2023
Fix for Now

- The OSPO is responsible for promoting strict compliance with licensing across the entire company,
- an office dedicated to preparing the company to understand the culture of OSS communities and act appropriately within the organization to leverage them.
- With the long-term goal of contributing to external OSS communities, the OSPO first facilitates the sharing of OSS information internally, builds an internal OSS community, and fosters active interaction.

- The OSPO acts as a bridge to help the company collaborate with the distinct culture of open source, providing a framework for its smooth adoption and utilization;
- it is an organization that facilitates collaboration with OSS communities, groups, and organizations—which embody the distinct culture of open source—and aims to ensure that its activities are naturally integrated into the community's momentum.

- The OSPO's role is to identify trends within the community, lead the community, generate new trends, and leverage them for the business
- and to work toward embedding the above principles as part of the corporate culture

- The role of raising awareness and promoting the adoption of licenses involves
- activities aimed at spreading the message that OSS is important and that licenses must be respected.

- Leadership
  - As a community leader, a key member of the decision-making process,
- engagement
  - decision-making meeting participants,
- community education
  - and an early contributor.

- One aspect of the OSPO's mission is to realize the principle that "community contribution equals company success."
- The role of the OSPO is to stay abreast of changes in industry culture and trends and to update the company's internal culture accordingly

Roles independent of stage:
- responsible for raising awareness and driving adoption,
- there is a lifecycle: it grows larger and then shrinks once it's established.

Qx Similarities with OSS/OSPO maturity levels in AI adoption: The role of OSPO in AI adoption (currently under trial consideration)

- The role involves driving efforts to ensure that respect for others' rights is thoroughly implemented throughout the entire company:
- a preparatory unit designed to help employees understand how AI utilizes third-party intellectual property and enable them to act in a manner that appropriately respects those rights within the company.
- First, we will share concerns and challenges regarding AI use within the company and build an internal community to foster active communication.

- Amid the emerging trend of AI, both AI developers and users are exploring ways to improve the situation; the OSPO's role is to convey the importance of collaboration between the two

- The OSPO's role is to identify trends within the community, lead the community, generate new trends, and leverage them for the business
- and working to ensure that the above principles become firmly established as part of the corporate culture

- Responsible for raising awareness and promoting the adoption of rights protection,
- activities aimed at spreading the message that copyright and information protection are important, and that licenses should be respected.

- One aspect of the OSPO's mission is to realize the principle that "community contribution equals company success."
- the OSPO's role is to identify changes in industry culture and trends and update the company's internal culture accordingly

FAQ Topics

- Born from the July 10, 2026 Strategy meeting:
  - How to Communicate the Benefits of Participation:
  - the value of building trust and networking within the community;
    - comments like, “I just want the information, so AI is fine”;
    - you’ll learn to discern whether information and its sources are reliable.
- the optimal maturity stage will likely be determined based on a company’s value within the supply chain.
- Will companies end up viewing OSS and its communities as competitors when formulating business strategies?
  - If a company develops software that competes with OSS,
    - companies that use that company’s software—and are, in a sense, under its control—will adopt a strategy of joining the community to escape that control.
  - If a company modifies OSS and uses it exclusively for its own business,
- Since strategic autonomy (Sovereignty) is a topic addressed at Stage 3 and above,
- how to advance through the stages: it might be helpful to prepare FAQ-style answers regarding what is required to move up to the next stage.
  - CLA, DCO, etc.
- The Role of OSPOs in the Age of AI
- OSPO and OSS Contributor Population Ratios by Stage: What Is the Ideal Situation?
  - the ideal distribution varies depending on the type of activity (e.g., bug fixes differ from the development of distinctive features).
  - The Reality and Challenges of OSS Adoption by Japanese Companies—FY2025 Software Trends Survey
- Skills Required of OSPO Personnel
- First Steps (Perhaps Starting from Scratch): Begin by “Understanding and Staying Informed About the Outside World,” Then Initiate and Institutionalize Efforts Internally
